NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

ARTICLE 502 — CLASS II LOCATIONS

(Log #1260)

14- 200 - (502): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: In 502-2(b)(2)(c), change "6 in. (152 mm)" to "150 mm (6 in.)".

In 502-5(2), change "10 ft (3.05 m)" to "3.0 m (10 ft)".

In 502-5(3), change "5 ft (1.52 m)" to "1.5 m (5 ft)."

In 502-11(a)(3), change "12 in. (305 mm) to "300 mm (12 in.)" in three places.

In 502-11(b)(4), change "12 in. (305 mm)" to "300 mm (12 in.)" in three places.

In 502-16(b), Exception (a), change "6 ft (1.83 m)" to "1.8 m (6 ft)."

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Reject.

PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 3

NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

KUCZKA: See my Explanation of Negative Vote on Proposal 14-10.

OMEARA: This proposal should be accepted, to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.

ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #CP1412)

14- 200a - (502): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. Further, it was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel, with further consideration given to the comments expressed in the voting, specifically with respect to comments that the accepted Proposal does not accurately reflect what was agreed upon by the Panel. It is the understanding of the Technical Correlating Committee that this proposal is modified by Proposals 14-201, 14-202, 14-204, 14-205, 14-206, 14-207, 14-207a, 14-208, 14-209, 14-210, 14-210a, 14-211, 14-212, 14-213, 14-216, 14-219, 14-223,14-224, 14-227, 14-228, 14-231, 14-232, 14-233, 14-234, 14-235, 14-236, 14-239, 14-240, 14-243, 14-244, 14-245, 14-246, 14-249, 14-250, 14-251, 14-252, 14-255, 14-256, 14-257, 14-258, 14-259, 14-262, 14-263, 14-264, 14-265, 14-266, 14-267, 14-268, 14-269, 14-270, and 14-271. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 14

RECOMMENDATION: Revise Article 502 to read as follows:

502

ARTICLE 502 -- Class II Locations

502-1. General

The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class II locations in Section 500-8.

Exception: As modified by this article.

Dust-ignitionproof, as used in this article, shall mean enclosed in a manner that will exclude dusts and, where installed and protected in accordance with this Code, will not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

> FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in Enclosures for Electrical Equipment, ANSI/NEMA 250-1991, and Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Equipment installed in Class II locations shall be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of any organic dust deposits that may occur.

> FPN: Dust that is carbonized or excessively dry is highly susceptible to spontaneous ignition.

Equipment and wiring of the type defined in Article 100 as explosionproof shall not be required and shall not be acceptable in Class II locations unless approved for such locations.

Where Class II, Group E dusts are present in hazardous quantities, there are only Division 1 locations.

502-2. Transformers and Capacitors

(a) Class II, Division 1. In Class II, Division 1 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in approved vaults complying with Sections 450-41 through 450-48, and, in addition, the following shall apply.

a. Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.

b. Vent openings and ducts shall communicate only with the outside air.

c. Suitable pressure-relief openings communicating with the outside air shall be provided.

(2) Not Containing Liquid that Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with Sections 450-41 through 450-48 or be approved as a complete assembly, including terminal connections for Class II locations.

(3) Metal Dusts. No transformer or capacitor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed in vaults that comply with Sections 450-41 through 450-48.

(2) Containing Askarel. Transformers containing askarel and rated in excess of 25 kVA shall be as follows:

a. Provided with pressure-relief vents

b. Provided with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vents shall be connected to a chimney or flue that will carry such gases outside the building

c. Have an airspace of not less than 6 in. (152 mm) between the transformer cases and any adjacent combustible material

(3) Dry-Type Transformers. Dry-type transformers shall be installed in vaults or shall have their windings and terminal connections enclosed in tight metal housings without ventilating or other openings and shall operate at not over 600 volts, nominal.

502-4. Wiring Methods

Wiring methods shall comply with (a) and (b).

(a) Class II, Division 1. In Class II, Division 1 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, or Type MI cable with termination fittings approved for the location shall be the wiring method employed. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

Exception: In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight

continuous corrugated aluminum sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.

(1) Fittings and Boxes. Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations, shall have close-fitting covers, and shall have no openings (such as holes for attachment screws) through which dust might enter or through which sparks or burning material might escape. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in locations where dusts are of a combustible, electrically conductive nature, shall be approved for Class II locations.

(2) Flexible Connections. Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with approved fittings, or flexible cord approved for extra-hard usage and provided with bushed fittings shall be used. Where flexible cords are used, they shall comply with Section 502-12. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type approved for the condition or shall be protected by means of a suitable sheath.
FPN: See Section 502-16(b) for grounding requirements where flexible conduit is used.

(b) Class II, Division 2. In Class II, Division 2 locations, rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, Type MC or MI cable with approved termination fittings, Type PLTC in cable trays, Type ITC in cable trays, or Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.
Exception No. 1: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in nonhazardous ~~ordinary~~ locations including Chapter 7 and 8 wiring methods.(14-220)
Exception No. 2: Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the above required spacings.

(1) Boxes and Fittings. All boxes and fittings shall be dusttight. (14-222)

~~(1) Wireways, Fittings, and Boxes. Wireways, fittings, and boxes in which taps, joints, or terminal connections are made shall be designed to minimize the entrance of dust and (1) shall be provided with telescoping or close-fitting covers or other effective means to prevent the escape of sparks or burning material and (2) shall have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which adjacent combustible material might be ignited.~~

(2) Flexible Connections. Where flexible connections are necessary, (a)(2) shall apply.

502-5. Sealing, Class II, Divisions 1 and 2
Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and one that is not, suitable means shall be provided to prevent the entrance of dust into the dust-ignitionproof enclosure through the raceway. One of the following means shall be permitted:
1. A permanent and effective seal,
2. A horizontal raceway not less than 10 ft (3.05 m) long, or
3. A vertical raceway not less than 5 ft (1.52 m) long and extending downward from the dust-ignitionproof enclosure
Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and an enclosure in an unclassified location, seals shall not be required.
Sealing fittings shall be accessible.
Seals shall not be required to be explosionproof.
FPN: Electrical sealing putty is a method of sealing.

502-6. Switches, Circuit Breakers, Motor Controllers, and Fuses
(a) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with the following:
(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with approved dust-ignitionproof enclosures.
(2) Isolating Switches. Disconnecting and isolating switches containing no fuses and not intended to interrupt current and not installed where dusts may be of an electrically conductive nature shall be provided with tight metal enclosures that shall be designed to minimize the entrance of dust and that shall (1) be equipped with telescoping or close-fitting covers or with other effective means to prevent the escape of sparks or burning material and (2) have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which exterior accumulations of dust or adjacent combustible material might be ignited.

(3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified ~~specifically approved~~(14-225,226)~~-~~for such locations.

(b) Class II, Division 2. In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, shall be dusttight.

502-7. Control Transformers and Resistors
(a) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall have dust-ignitionproof enclosures approved for Class II locations. No control transformer, impedance coil, or resistor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present unless provided with an enclosure approved for the specific location.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and resistors shall comply with the following.
(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with dusttight enclosures.
(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with tight metal housings without ventilating openings.
(3) Resistors. Resistors and resistance devices shall have dust-ignitionproof enclosures~~-~~ identified ~~approved.~~ for Class II locations.(14-229)
Exception: Where the maximum normal operating temperature of the resistor will not exceed 120ºC (248ºF), nonadjustable resistors or resistors that are part of an automatically timed starting sequence shall be permitted to have enclosures complying with (b)(2).

502-8. Motors and Generators
(a) Class II, Division 1. In Class II, Division 1 locations, motors, generators, and other rotating electrical machinery shall be
1. Approved for Class II, Division 1 locations, or
2. Totally enclosed pipe-ventilated, meeting temperature limitations in Section 502-1.

(b) Class II, Division 2. In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water–air cooled, totally enclosed fan-cooled or dust-ignitionproof for which maximum full-load external temperature shall be in accordance with Section 500-5(f) for normal operation when operating in free air (not dust blanketed) and shall have no external openings.
Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:
a. Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices

b. Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings
c. Self-cleaning textile motors of the squirrel-cage type

502-9. Ventilating Piping
Ventilating pipes for motors, generators, or other rotating electric machinery, or for enclosures for electric equipment, shall be of metal not less than 0.021 in. (533 µm) in thickness, or of equally substantial noncombustible material, and shall comply with the following:
1. Lead directly to a source of clean air outside of buildings,
2. Be screened at the outer ends to prevent the entrance of small animals or birds, and
3. Be protected against physical damage and against rusting or other corrosive influences
Ventilating pipes shall also comply with (a) and (b).

(a) Class II, Division 1. In Class II, Division 1 locations, ventilating pipes, including their connections to motors or to the dust-ignitionproof enclosures for other equipment, shall be dusttight throughout their length. For metal pipes, seams and joints shall comply with one of the following:
1. Be riveted and soldered,
2. Be bolted and soldered,
3. Be welded, or
4. Be rendered dusttight by some other equally effective means

(b) Class II, Division 2. In Class II, Division 2 locations, ventilating pipes and their connections shall be sufficiently tight to prevent the entrance of appreciable quantities of dust into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite dust accumulations or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

502-10. Utilization Equipment
(a) Class II, Division 1. In Class II, Division 1 locations, all utilization equipment shall be approved for Class II locations. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, such equipment shall be approved for the specific location.

(b) Class II, Division 2. In Class II, Division 2 locations, all utilization equipment shall comply with the following.
(1) Heaters. Electrically heated utilization equipment shall be approved for Class II locations.
Exception: Metal-enclosed radiant heating panel equipment shall be dusttight and marked in accordance with Section 500-5(d).
(2) Motors. Motors of motor-driven utilization equipment shall comply with Section 502-8(b).
(3) Switches, Circuit Breakers, and Fuses. Enclosures for switches, circuit breakers, and fuses shall be dusttight.
(4) Transformers, Solenoids, Impedance Coils, and Resistors. Transformers, solenoids, impedance coils, and resistors shall comply with Section 502-7(b).

502-11. Lighting Fixtures
Lighting fixtures shall comply with (a) and (b).
(a) Class II, Division 1. In Class II, Division 1 locations, lighting fixtures for fixed and portable lighting shall comply with the following.
(1) ~~Approved~~ Fixtures. Each fixture shall be identified ~~approved~~ for Class II locations and shall be clearly marked to indicate the maximum wattage of the lamp for which it is designed ~~approved~~. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fixtures for fixed or portable lighting and all auxiliary equipment shall be identified ~~approved~~ for the specific location. (14-237)
(2) Physical Damage. Each fixture shall be protected against physical damage by a suitable guard or by location.
(3) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector approved for the location shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set-screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord approved for hard usage shall be used, and suitable seals shall be provided where the cord enters the fixture and the outlet box or fitting. Flexible cord shall not serve as the supporting means for a fixture.

(4) Supports. Boxes, box assemblies, or fittings used for the support of lighting fixtures shall be approved for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, lighting fixtures shall comply with the following.
(1) Portable Lighting Equipment. Portable lighting equipment shall be identified ~~approved~~ for Class II locations. They shall be clearly marked to indicate the maximum wattage of lamps for which they are designed ~~approved~~. (14-247).
(2) Fixed Lighting. Lighting fixtures for fixed lighting, where not of a type approved for Class II locations, shall provide enclosures for lamps and lampholders that shall be designed to minimize the deposit of dust on lamps and to prevent the escape of sparks, burning material, or hot metal. Each fixture shall be clearly marked to indicate the maximum wattage of the lamp that shall be permitted without exceeding an exposed surface temperature in accordance with Section 500-5(f) under normal conditions of use.
(3) Physical Damage. Lighting fixtures for fixed lighting shall be protected from physical damage by suitable guards or by location.
(4) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of an approved fitting or a flexible connector shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting. Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord approved for hard usage shall be used. Flexible cord shall not serve as the supporting means for a fixture.
(5) Electric-Discharge Lamps. Starting and control equipment for electric-discharge lamps shall comply with the requirements of Section 502-7(b).

502-12. Flexible Cords — Class II, Divisions 1 and 2
Flexible cords used in Class II locations shall comply with the following:
1. Be of a type approved for extra-hard usage,
FPN: Flexible cord listed for hard usage as permitted by Sections 502-11 (a) (3) and (b) (4). (14-257)
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23,
3. Be connected to terminals or to supply conductors in an approved manner,
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections, and
5. Be provided with suitable seals to prevent the entrance of dust where the flexible cord enters boxes or fittings that are required to be dust-ignitionproof

502-13. Receptacles and Attachment Plugs
(a) Class II, Division 1. In Class II, Division 1 locations, receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of the flexible cord and shall be approved for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, receptacles and attachment plugs shall be of the type that provide for connection to the grounding conductor of the flexible cord and shall be designed so that connection to the supply circuit cannot be made or broken while live parts are exposed.

502-14. Signaling, Alarm, Remote-Control, and Communications Systems; and Meters, Instruments, and Relays
FPN: See Article 800 for rules governing the installation of communications circuits.

(a) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with the following:
(1) Wiring Methods. The wiring method shall comply with Section 502-4(a).

(2) Contacts. Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs may be produced shall be provided with enclosures approved for a Class II location.
Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.
(3) Resistors and Similar Equipment. Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures approved for Class II locations.
Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.
(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with Section 502-8(a).
(5) Combustible, Electrically Conductive Dusts. Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be approved for Class II locations.
(6) Metal Dusts. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, all apparatus and equipment shall be approved for the specific conditions.

(b) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with the following.
(1) Contacts. Enclosures shall comply with (a)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape.
Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.
(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall be provided with tight metal enclosures without ventilating openings.
(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with (a)(3).
Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120ºC (248ºF) shall be permitted to be of the general-purpose type.
(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with Section 502-8(b).
(5) Wiring Methods. The wiring method shall comply with Section 502-4(b).

502-15. Live Parts, Class II, Divisions 1 and 2
Live parts shall not be exposed.

502-16. Grounding, Class II, Divisions 1 and 2
Wiring and equipment in Class II, Divisions 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements.
(a) Bonding. The locknut-bushing and double-locknut types of contact shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), if the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.
(b) Types of Equipment Grounding Conductors. Where flexible conduit is used as permitted in Section 502-4, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.
Exception: In Class II, Division 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

502-17. Surge Protection — Class II, Divisions 1 and 2
Surge arresters, including their installation and connection, shall comply with Article 280. In addition, surge arresters, if installed in a Class II, Division 1 location, shall be in suitable enclosures. Surge-protective capacitors shall be of a type designed for specific duty.

502-18. Multiwire Branch Circuits
In a Class II, Division 1 location, a multiwire branch circuit shall not be permitted.
Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.
SUBSTANTIATION: This complete revision of Article 502 editorially revises the text to make it more easily understood and also incorporates numerous technical and editorial improvements made via other proposals.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban
COMMENT ON AFFIRMATIVE:
BRIESCH: While the Panel Action to accept the rewrite of Article 502 is supported, the NFPA-circulated Panel Proposal does not include all of the changes agreed to at the meeting. The e-mail sent by Dave Wechsler subsequent to the meeting is more complete in reflecting the Panel Actions from the meeting.
COOK: I agree with Proposal 14-200a and the substantiation, however, it does not incorporate all of the changes made via other proposals. An updated version that was emailed from Dave Wechsler on 1-26-2000 seems to be more complete with respect to including Panel Actions from the meeting in Hilton Head.
ENGLER: Not all of the changes made it into the draft circulated with this ballot, vote is to affirm the text with all of the necessary changes made to it.
JAGUNICH: The panel proposal sent with the ballot material does not appear to be consistent with CMP14's intent, as expressed during the panel meeting. This rewrite should reexamined and modified as necessary.
LAWRENCE: Due to the large number of public proposals received and acted upon and also due to time constraints, the panel was not able to compile and correlate all aspects of the rewrites of the affected article. Please see David Wechsler's ballot.
OMEARA: Please see the comments on the ballot for David Wechsler.
WECHSLER: While attempts were made to provide NFPA Staff with corrected revisions of this text before the end of the CMP 14 panel meeting, a detailed review of this balloted draft version has indicated that this does not reflect the accurate committee actions and is not correct.
We attribute the problems with this draft to the following:
a) the use of several earlier drafts that were consistently being revised to keep pace with changes made due to committee actions on public proposals,
b) the limited time available to proof and develop this work,
c) the extremely large number of public proposals,
d) the complex nature of the interaction of affected texts within Articles 500, 501, 502 and 505, and the desire of the committee to maintain consistency, and
e) human errors in transcribing this information.
The following text provides a correct revision of this complete work effort for Article 502. This text should be the panel document of record and not that provided with the panel ballot.

ARTICLE 502 -- Class II Locations
502-1. General
The general rules of this Code shall apply to the electric wiring and equipment in locations classified as Class II locations in Section 500-5(c)~~500 8~~.
Exception: As modified by this article.

Dust-ignitionproof, as used in this article, shall mean enclosed in a manner that will exclude dusts and, where installed and protected in accordance with this Code, will not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

FPN: For further information on dust-ignitionproof enclosures, see Type 9 enclosure in Enclosures for Electrical Equipment, ANSI/NEMA 250-1991, and Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations, ANSI/UL 1203-1994.

Equipment installed in Class II locations shall be able to function at full rating without developing surface temperatures high enough to cause excessive dehydration or gradual carbonization of any organic dust deposits that may occur.

FPN: Dust that is carbonized or excessively dry is highly susceptible to spontaneous ignition.

Equipment and wiring of the type defined in Article 100 as explosionproof shall not be required and shall not be acceptable in Class II locations unless identified ~~approved~~ [14-201, 14-202]- for such locations.

Where Class II, Group E dusts are present in hazardous quantities, there are only Division 1 locations.

502-2. Transformers and Capacitors

(a) Class II, Division 1. In Class II, Division 1 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed only in ~~approved~~ [14-204,14-205]- vaults complying with Sections 450-41 through 450-48, and, in addition, the following shall apply.

a. Doors or other openings communicating with the Division 1 location shall have self-closing fire doors on both sides of the wall, and the doors shall be carefully fitted and provided with suitable seals (such as weather stripping) to minimize the entrance of dust into the vault.

b. Vent openings and ducts shall communicate only with the outside air.

c. Suitable pressure-relief openings communicating with the outside air shall be provided.

(2) Not Containing Liquid that Will Burn. Transformers and capacitors that do not contain a liquid that will burn shall be installed in vaults complying with Sections 450-41 through 450-48 or be identified ~~approved~~ [14-206,14-207]- as a complete assembly, including terminal connections for Class II locations.

(3) Metal Dusts. No transformer or capacitor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and capacitors shall comply with the following.

(1) Containing Liquid that Will Burn. Transformers and capacitors containing a liquid that will burn shall be installed in vaults that comply with Sections 450-41 through 450-48.

(2) Containing Askarel. Transformers containing askarel and rated in excess of 25 kVA shall be as follows:

a. Provided with pressure-relief vents

b. Provided with a means for absorbing any gases generated by arcing inside the case, or the pressure-relief vents shall be connected to a chimney or flue that will carry such gases outside the building

c. Have an airspace of not less than 6 in. (152 mm) between the transformer cases and any adjacent combustible material

(3) Dry-Type Transformers. Dry-type transformers shall be installed in vaults or shall have their windings and terminal connections enclosed in tight metal housings without ventilating or other openings and shall operate at not over 600 volts, nominal.

502-4. Wiring Methods

Wiring methods shall comply with (a) or ~~and~~ (b). (CP-1409 to correlate with 501-4)

(a) Class II, Division 1. In Class II, Division 1 locations, threaded rigid metal conduit, threaded steel intermediate metal conduit, or Type MI cable with termination fittings listed ~~approved~~ [14-208,14-209]- for the location shall be the wiring method employed. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

Exception: In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic ~~aluminum~~ [14-210]- sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.

(1) Fittings and Boxes. Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations and shall be dust-tight. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in Group E, shall be identified for Class II locations.~~, shall have close fitting covers, and shall have no openings (such as holes for attachment screws) through which dust might enter or through which sparks or burning material might escape. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in locations where dusts are of a combustible, electrically conductive nature, shall be approved for Class II locations.~~ (14-211,14-212,CP-1408)

(2) Flexible Connections. Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with listed ~~approved~~ fittings, or flexible cord listed ~~approved~~ for extra-hard usage and provided with bushed fittings shall be used. Where flexible cords are used, they shall comply with Section 502-12. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed ~~approved~~ for the condition or shall be protected by means of a suitable sheath. [14-213]

FPN: See Section 502-16(b) for grounding requirements where flexible conduit is used.

(b) Class II, Division 2. In Class II, Division 2 locations, rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, Type MC or MI cable with listed ~~approved~~ [14-216,14-219]- termination fittings, Type PLTC in cable trays, Type ITC in cable trays, or Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.

Exception No. 1: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in nonhazardous ~~ordinary~~ locations including Chapter 7 and 8 wiring methods.(14-220)

Exception No. 2: Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the above required spacings.

(1) Boxes and Fittings. All boxes and fittings shall be dusttight. (14-221,14-222)

~~(1) Wireways, Fittings, and Boxes. Wireways, fittings, and boxes in which taps, joints, or terminal connections are made shall be designed to minimize the entrance of dust and (1) shall be provided with telescoping or close fitting covers or other effective means to prevent the escape of sparks or burning material and (2) shall have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which adjacent combustible material might be ignited.~~

(2) Flexible Connections. Where flexible connections are necessary, (a)(2) shall apply.

Rewrite of above section 502-4 to correlate with 501-4 and as modified by Proposals

502-4. Wiring Methods

Wiring methods shall comply with (a) or (b). (CP-1409 to correlate with 501-4)

(a) Class II, Division 1 .

(1) In Class II, Division 1 locations, the following wiring methods shall be permitted:

(a) Threaded rigid metal conduit, or threaded steel intermediate metal conduit may be used.

(b) Type MI cable with termination fittings listed [14-208,14-209] for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(c) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic [14-210] sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.

(d) Fittings and boxes shall be provided with threaded bosses for connection to conduit or cable terminations and shall be dust-tight. Fittings and boxes in which taps, joints, or terminal connections are made, or that are used in Group E, shall be identified for Class II locations. (14-211,14-212,CP-1408)

(e) Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with bushed fittings shall be used. Where flexible cords are used, they shall comply with Section 502-12. Where flexible connections are subject to oil or other corrosive conditions, the insulation of the conductors shall be of a type listed for the condition or shall be protected by means of a suitable sheath. [14-213]

FPN: See Section 502-16(b) for grounding requirements where flexible conduit is used.

(b) Class II, Division 2.

(1) In Class II, Division 2 locations, the following wiring methods shall be permitted:

a. Rigid metal conduit, intermediate metal conduit, electrical metallic tubing,
b. Dusttight wireways,
c. Type MC or MI cable with listed [14-216,14-219]termination fittings,
d. Type PLTC in cable trays,
e. Type ITC in cable trays,
f. Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.

Exception: Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the above required spacings.

(2) Where provision must be made for flexibility apply 502-4 (a)(1)(e.)

(3) Nonincendive field wiring shall be permitted using any of the wiring methods permitted for nonhazardous [14-81,14-88,1401, 14-220] locations, including Chapter 7 and 8 wiring methods. Nonincendive field wiring systems shall be installed in accordance with the control drawing(s). (14-83)

(4) All boxes and fittings shall be dusttight. (14-221,14-222)

502-5. Sealing, Class II, Divisions 1 and 2

Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and one that is not, suitable means shall be provided to prevent the entrance of dust into the dust-ignitionproof enclosure through the raceway. One of the following means shall be permitted:
1. A permanent and effective seal,
2. A horizontal raceway not less than 10 ft (3.05 m) long, or
3. A vertical raceway not less than 5 ft (1.52 m) long and extending downward from the dust-ignitionproof enclosure

Where a raceway provides communication between an enclosure that is required to be dust-ignitionproof and an enclosure in an unclassified location, seals shall not be required.
Sealing fittings shall be accessible.
Seals shall not be required to be explosionproof.
FPN: Electrical sealing putty is a method of sealing.

502-6. Switches, Circuit Breakers, Motor Controllers, and Fuses

(a) Class II, Division 1. In Class II, Division 1 locations, switches, circuit breakers, motor controllers, and fuses shall comply with the following:
(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with identified ~~approved~~ [14-223,14-224] dust-ignitionproof enclosures.
(2) Isolating Switches. Disconnecting and isolating switches containing no fuses and not intended to interrupt current and not installed where dusts may be of an electrically conductive nature shall be provided with tight metal enclosures that shall be designed to minimize the entrance of dust and that shall (1) be equipped with telescoping or close-fitting covers or with other effective means to prevent the escape of sparks or burning material and (2) have no openings (such as holes for attachment screws) through which, after installation, sparks or burning material might escape or through which exterior accumulations of dust or adjacent combustible material might be ignited.

(3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures identified ~~specifically approved~~(14-225,14-226)- for such locations.

(b) Class II, Division 2. In Class II, Division 2 locations, enclosures for fuses, switches, circuit breakers, and motor controllers, including pushbuttons, relays, and similar devices, shall be dusttight.

502-7. Control Transformers and Resistors

(a) Class II, Division 1. In Class II, Division 1 locations, control transformers, solenoids, impedance coils, resistors, and any overcurrent devices or switching mechanisms associated with them shall have dust-ignitionproof enclosures approved for Class II locations. No control transformer, impedance coil, or resistor shall be installed in a location where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present unless provided with an enclosure identified ~~approved~~ [14-227, 14-228]- for the specific location.

(b) Class II, Division 2. In Class II, Division 2 locations, transformers and resistors shall comply with the following.
(1) Switching Mechanisms. Switching mechanisms (including overcurrent devices) associated with control transformers, solenoids, impedance coils, and resistors shall be provided with dusttight enclosures.
(2) Coils and Windings. Where not located in the same enclosure with switching mechanisms, control transformers, solenoids, and impedance coils shall be provided with tight metal housings without ventilating openings.
(3) Resistors. Resistors and resistance devices shall have dust-ignitionproof enclosures~~.~~ identified ~~approved.~~ for Class II locations.(14-229,14-230)
Exception: Where the maximum normal operating temperature of the resistor will not exceed 120ºC (248ºF), nonadjustable resistors or resistors that are part of an automatically timed starting sequence shall be permitted to have enclosures complying with (b)(2).

502-8. Motors and Generators

(a) Class II, Division 1. In Class II, Division 1 locations, motors, generators, and other rotating electrical machinery shall be
1. Identified ~~Approved~~[14-231, 14-232]- for Class II, Division 1 locations, or
2. Totally enclosed pipe-ventilated, meeting temperature limitations in Section 502-1.

(b) Class II, Division 2. In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally

enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water–air cooled, totally enclosed fan-cooled or dust-ignitionproof for which maximum full-load external temperature shall be in accordance with Section 500-8(c)(2) ~~500-5(f)~~ for normal operation when operating in free air (not dust blanketed) and shall have no external openings.
Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:
a. Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices
b. Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings
c. Self-cleaning textile motors of the squirrel-cage type

502-9. Ventilating Piping
Ventilating pipes for motors, generators, or other rotating electric machinery, or for enclosures for electric equipment, shall be of metal not less than 0.021 in. (533 µm) in thickness, or of equally substantial noncombustible material, and shall comply with the following:
1. Lead directly to a source of clean air outside of buildings,
2. Be screened at the outer ends to prevent the entrance of small animals or birds, and
3. Be protected against physical damage and against rusting or other corrosive influences
Ventilating pipes shall also comply with (a) and (b).

(a) Class II, Division 1. In Class II, Division 1 locations, ventilating pipes, including their connections to motors or to the dust-ignitionproof enclosures for other equipment, shall be dusttight throughout their length. For metal pipes, seams and joints shall comply with one of the following:
1. Be riveted and soldered,
2. Be bolted and soldered,
3. Be welded, or
4. Be rendered dusttight by some other equally effective means

(b) Class II, Division 2. In Class II, Division 2 locations, ventilating pipes and their connections shall be sufficiently tight to prevent the entrance of appreciable quantities of dust into the ventilated equipment or enclosure and to prevent the escape of sparks, flame, or burning material that might ignite dust accumulations or combustible material in the vicinity. For metal pipes, lock seams and riveted or welded joints shall be permitted; and tight-fitting slip joints shall be permitted where some flexibility is necessary, as at connections to motors.

502-10. Utilization Equipment
(a) Class II, Division 1. In Class II, Division 1 locations, all utilization equipment shall be identified ~~approved~~ [14-233,14-234] for Class II locations. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, such equipment shall be approved for the specific location.

(b) Class II, Division 2. In Class II, Division 2 locations, all utilization equipment shall comply with the following.
(1) Heaters. Electrically heated utilization equipment shall be identified ~~approved~~ [14-235,14-236]- for Class II locations.
Exception: Metal-enclosed radiant heating panel equipment shall be dusttight and marked in accordance with Section 500-8 (b)~~500-5(d)~~.
(2) Motors. Motors of motor-driven utilization equipment shall comply with Section 502-8(b).
(3) Switches, Circuit Breakers, and Fuses. Enclosures for switches, circuit breakers, and fuses shall be dusttight.
(4) Transformers, Solenoids, Impedance Coils, and Resistors. Transformers, solenoids, impedance coils, and resistors shall comply with Section 502-7(b).

502-11. Lighting Fixtures
Lighting fixtures shall comply with (a) and (b).
(a) Class II, Division 1. In Class II, Division 1 locations, lighting fixtures for fixed and portable lighting shall comply with the following.
(1) ~~Approved~~ Fixtures. Each fixture shall be identified ~~approved~~ for Class II locations and shall be clearly marked to indicate the maximum wattage of the lamp for which it is designed ~~approved~~. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fixtures for fixed or portable lighting and all auxiliary equipment shall be identified ~~approved~~ for the specific location. (14-237,14-238)
(2) Physical Damage. Each fixture shall be protected against physical damage by a suitable guard or by location.
(3) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of a fitting or a flexible connector listed ~~approved~~ [14-240,14-243]- for the location shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting. Threaded joints shall be provided with set-screws or other effective means to prevent loosening. Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord listed ~~approved~~ [14-239,14-244]- for hard usage shall be used, and suitable seals shall be provided where the cord enters the fixture and the outlet box or fitting. Flexible cord shall not serve as the supporting means for a fixture.

(4) Supports. Boxes, box assemblies, or fittings used for the support of lighting fixtures shall be identified ~~approved~~ [14-245,14-246]- for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, lighting fixtures shall comply with the following.
(1) Portable Lighting Equipment. Portable lighting equipment shall be identified ~~approved~~ for Class II locations. They shall be clearly marked to indicate the maximum wattage of lamps for which they are designed~~approved~~ [14-247,14-248].
(2) Fixed Lighting. Lighting fixtures for fixed lighting, where not of a type identified ~~approved~~ [14-249,14-250]- for Class II locations, shall provide enclosures for lamps and lampholders that shall be designed to minimize the deposit of dust on lamps and to prevent the escape of sparks, burning material, or hot metal. Each fixture shall be clearly marked to indicate the maximum wattage of the lamp that shall be permitted without exceeding an exposed surface temperature in accordance with Section 500-8 (c)(2)~~500-5(f)~~ under normal conditions of use.
(3) Physical Damage. Lighting fixtures for fixed lighting shall be protected from physical damage by suitable guards or by location.
(4) Pendant Fixtures. Pendant fixtures shall be suspended by threaded rigid metal conduit stems, threaded steel intermediate metal conduit stems, by chains with approved fittings, or by other approved means. For rigid stems longer than 12 in. (305 mm), permanent and effective bracing against lateral displacement shall be provided at a level not more than 12 in. (305 mm) above the lower end of the stem, or flexibility in the form of an approved fitting or a flexible connector shall be provided not more than 12 in. (305 mm) from the point of attachment to the supporting box or fitting. Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord listed ~~approved~~ [14-251,14-256]- for hard usage shall be used. Flexible cord shall not serve as the supporting means for a fixture.
(5) Electric-Discharge Lamps. Starting and control equipment for electric-discharge lamps shall comply with the requirements of Section 502-7(b).

502-12. Flexible Cords — Class II, Divisions 1 and 2
Flexible cords used in Class II locations shall comply with the following:
1. Be of a type listed ~~approved~~ [14-258,14-259]- for extra-hard usage,
FPN: Flexible cord listed for hard usage as permitted by Sections 502-11 (a) (3) and (b) (4). (14-257)
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23,
3. Be connected to terminals or to supply conductors in an approved manner,
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal connections, and
5. Be provided with suitable seals to prevent the entrance of dust where the flexible cord enters boxes or fittings that are required to be dust-ignitionproof

502-13. Receptacles and Attachment Plugs
(a) Class II, Division 1. In Class II, Division 1 locations, receptacles and attachment plugs shall be of the type providing for connection to the grounding conductor of the flexible cord and shall be identified ~~approved~~ [14-262,14-263]- for Class II locations.

(b) Class II, Division 2. In Class II, Division 2 locations, receptacles and attachment plugs shall be of the type that provide for connection to the grounding conductor of the flexible cord and shall be designed so that connection to the supply circuit cannot be made or broken while live parts are exposed.

502-14. Signaling, Alarm, Remote-Control, and Communications Systems; and Meters, Instruments, and Relays
FPN: See Article 800 for rules governing the installation of communications circuits.

(a) Class II, Division 1. In Class II, Division 1 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with the following:
(1) Wiring Methods. The wiring method shall comply with Section 502-4(a).
(2) Contacts. Switches, circuit breakers, relays, contactors, fuses and current-breaking contacts for bells, horns, howlers, sirens, and other devices in which sparks or arcs may be produced shall be provided with enclosures identified ~~approved~~ [14-264,14-265]- for a Class II location.
Exception: Where current-breaking contacts are immersed in oil or where the interruption of current occurs within a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.
(3) Resistors and Similar Equipment. Resistors, transformers, choke coils, rectifiers, thermionic tubes, and other heat-generating equipment shall be provided with enclosures identified ~~approved~~ [14-266,14-267]- for Class II locations.
Exception: Where resistors or similar equipment are immersed in oil or enclosed in a chamber sealed against the entrance of dust, enclosures shall be permitted to be of the general-purpose type.
(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with Section 502-8(a).
(5) Combustible, Electrically Conductive Dusts. Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be identified ~~approved~~ [14-268,14-269]- for Class II locations.
(6) Metal Dusts. Where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, all apparatus and equipment shall be identified ~~approved~~ [14-270,14-271]for the specific conditions.

(b) Class II, Division 2. In Class II, Division 2 locations, signaling, alarm, remote-control, and communications systems; and meters, instruments, and relays shall comply with the following.
(1) Contacts. Enclosures shall comply with (a)(2), or contacts shall have tight metal enclosures designed to minimize the entrance of dust and shall have telescoping or tight-fitting covers and no openings through which, after installation, sparks or burning material might escape.
Exception: In nonincendive circuits, enclosures shall be permitted to be of the general-purpose type.
(2) Transformers and Similar Equipment. The windings and terminal connections of transformers, choke coils, and similar equipment shall be provided with tight metal enclosures without ventilating openings.
(3) Resistors and Similar Equipment. Resistors, resistance devices, thermionic tubes, rectifiers, and similar equipment shall comply with (a)(3).
Exception: Enclosures for thermionic tubes, nonadjustable resistors, or rectifiers for which maximum operating temperature will not exceed 120ºC (248ºF) shall be permitted to be of the general-purpose type.
(4) Rotating Machinery. Motors, generators, and other rotating electric machinery shall comply with Section 502-8(b).
(5) Wiring Methods. The wiring method shall comply with Section 502-4(b).

502-15. Live Parts, Class II, Divisions 1 and 2
Live parts shall not be exposed.

502-16. Grounding, Class II, Divisions 1 and 2
Wiring and equipment in Class II, Divisions 1 and 2 locations shall be grounded as specified in Article 250 and with the following additional requirements.
(a) Bonding. The locknut-bushing and double-locknut types of contact shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class II locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode conductor are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), if the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.
(b) Types of Equipment Grounding Conductors. Where flexible conduit is used as permitted in Section 502-4, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.
Exception: In Class II, Division 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

502-17. Surge Protection — Class II, Divisions 1 and 2
Surge arresters, including their installation and connection, shall comply with Article 280. In addition, surge arresters, if installed in a Class II, Division 1 location, shall be in suitable enclosures. Surge-protective capacitors shall be of a type designed for specific duty.

502-18. Multiwire Branch Circuits
In a Class II, Division 1 location, a multiwire branch circuit shall not be permitted.
Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

(Log #1960)

14- 201 - (502-1): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise the fourth paragraph to read as follows:
Equipment and wiring of the type defined in Article 100 as explosionproof shall not be required and shall not be acceptable in Class II locations unless ~~approved~~ (identified) for such locations.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.
COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #3522)

14- 202 - (502-1): Accept
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise the fourth paragraph to read as follows:
"Equipment and wiring of the type defined in Article 100 as explosionproof shall not be required and shall not be acceptable in Class II locations unless ~~approved~~ (identified) for such locations."
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.

EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #1793)

14- 203 - (502-1-Dust-ignitionproof): Accept in Principle
Note: The Technical Correlating Committee directs that the Panel clarify the Panel Action and Statement on this Proposal. Companion Proposal 1-127 was rejected by Code-Making Panel 1. Code-Making Panel 14 has included a definition for Dust-ignitionproof in both Articles 500 (Proposal 14-2a) and 502 (Proposal 14-200a) and has not deleted the text as recommended by the submitter. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Relocate the definition of Dust-ignitionproof and the related FPN to Article 100, and delete the text that applies the definition only to Article 502.
SUBSTANTIATION: The term "Dust-ignitionproof" is used in both Articles 500 and 502. For the purposes of Article 500 the term is undefined because the definition in Article 502 applies only to Article 502. In addition, according to Section 500-4(b) FPN, "Dust-ignitionproof equipment is defined in Article 100."
A similar proposal was made for the 1999 NEC and it was rejected by Panel 14. It is difficult to understand why the panel insisted on allowing and the TC allowed this plain error to continue. As presently located this definition contradicts the scope statement of Article 100, violates the manual of style, allows an undefined terms to be used in Article 500, and makes the statement of the fine print note in Section 500-4(b) false and misleading.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-2a addresses this issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #1793a)

1- 313 - (502-1-Dust-ignitionproof): Reject
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Relocate the definition of Dust-ignitionproof and the related FPN to Article 100, and delete the text that applies the definition only to Article 502.
SUBSTANTIATION: The term "Dust-ignitionproof" is used in both Articles 500 and 502. For the purposes of Article 500 the term is undefined because the definition in Article 502 applies only to Article 502. In addition, according to Section 500-4(b) FPN, "Dust-ignitionproof equipment is defined in Article 100."
A similar proposal was made for the 1999 NEC and it was rejected by Panel 14. It is difficult to understand why the panel insisted on allowing and the TC allowed this plain error to continue. As presently located this definition contradicts the scope statement of Article 100, violates the manual of style, allows an undefined terms to be used in Article 500, and makes the statement of the fine print note in Section 500-4(b) false and misleading.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes the definition is more appropriate in Article 502. Refer to CMP-14 for comment.

(Log #2652)

14- 204 - (502-2(a)(1)): Accept in Part
SUBMITTER: Donald R. Cook, Southern Section, IAEI
RECOMMENDATION: Revise text to read as follows:
(1) Containing Liquid that Will Burn. Transformers and capacitors containing liquid that will burn shall be installed only in ~~approved~~ (identified) vaults that comply with Sections 450-41 through 450-48, and, in addition, the following shall apply.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Part.
Delete the word "approved".
PANEL STATEMENT: Transformer vaults are not normally identified.

(Log #2997)

14- 210 - (502-4(a), Exception): Accept
SUBMITTER: Michael P. Mennone, Rockbestos-Surprenant Cable Corp.
RECOMMENDATION: Revise 502-4(a) exception to read as follows:
Exception: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated ~~aluminum~~ metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.
SUBSTANTIATION: Type MC with a gas/vaportight continuous corrugated sheath is manufactured and listed with various (aluminum, stainless steel, copper) sheath materials. In response to the acceptance of this exception (which was to be added to the 1996 NEC), UL Standard No. 2225 entitled "Metal-Clad Cables and Cable-Sealing Fittings for Use in Hazardous (Classified) Locations" was developed to qualify Type MC cables for this specific use. Cables meeting these additional requirements would then be listed as Type MC-HL. Copper and stainless steel sheathed Type MC cables have the same ability as aluminum to meet the intent of this section and also possess the ability to meet all of the additional requirements stated in UL Standard No. 2225. It is our contention that these additional types of sheathed cables were overlooked in

the original proposal. This capability does exist and should be recognized by the code.
PANEL ACTION: Accept.

(Log #2134)

14- 217 - (502-4(b)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 16 for information, with respect to Code-Making Panel 16's Panel Action on Proposal 16-319. Code-Making Panel 14 shall retain jurisdiction regarding types of wiring methods permitted in hazardous locations.
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Add the underlined text into the existing paragraph as follows:
(b) Class II, Division 2. In Class II, Division 2 locations, rigid metal conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, Type MC or MI cable with approved termination fittings, Type PLTC in cable trays, Type ITC in cable trays, Types CATVP, CATVR, CATV, or CATVX in cable tray, or Type MC, MI, or TC cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed.
SUBSTANTIATION: Type CATVP, CATVR, CATV, or CATVX coaxial cables, as described in Section 820-51, have the additional having fire-resistant characteristics similar to the requirements for other types of cables such as TC and ITC, which are currently permitted for Class II Division 2 locations. In addition they are suitable for installation in cable trays as permitted by Article 318. Coaxial cables are needed in modern industrial facilities for digital and video signal transmission.
PANEL ACTION: Reject.
PANEL STATEMENT: See Proposal 14-73.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
LAWRENCE: Panel action should have been "Accept in Part in Principle" with the removal of Type CATVX and the addition of support/protection requirements to correlate with the actions of Panel 16 on Proposal 16-318 to accept Types CATVP, CATVR, and CATV in Section 820-53(e).
COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-73.

(Log #2851)

14- 218 - (502-4(b)): Reject
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: Separation of Nonincendive Field Wiring Conductors
(a) From Nonincendive Field Wiring Conductors.
(1) Open Wiring. Conductors and cables of nonincendive field wiring circuits not in raceways or cable trays shall be separated at least 1.97 in. (50 mm) and secured from conductors and cables of any other circuits.
(2) In Raceways, Cable Trays, and Cables. Conductors of nonincendive field wiring circuits shall not be placed in any raceway, cable tray, or cable with conductors of any other circuit.
Exception No. 1: Where conductors of nonincendive field wiring circuits are separated from conductors of incendive field wiring circuits by a distance of at least 1.97 in. (50 mm) and secured, or by a grounded metal partition or an approved insulating partition.
FPN: No. 20 gauge sheet metal partitions 0.0359 in. (912 µm) or thicker are generally considered acceptable.
Exception No. 2: Where either (1) all of the nonincendive field wiring circuit conductors or (2) all of the incendive field wiring circuit conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.
FPN: Cables meeting the requirements of Articles 330 and 334 are typical of those considered acceptable.
(3) Within Enclosures.
a. Conductors of nonincendive field wiring circuits shall be separated at least 1.97 in. (50 mm) from conductors of any incendive field wiring circuits, or as specified in Section 501-4(b)(a)(2).
b. All conductors shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal.
FPN No. 1: The use of separate wiring compartments for the nonincendive field wiring and incendive field wiring terminals is the preferred method of complying with this requirement.
FPN No. 2: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least ≤ in. (19 mm) can be used to help ensure the required separation of the wiring.
(b) From Different Nonincendive Field Wiring Circuit Conductors. Different nonincendive field wiring circuits shall be in separate cables or shall be separated from each other by one of the following means.
1. The conductors of each circuit are within a grounded metal shield.
2. The conductors of each circuit have insulation with a minimum thickness of 0.01 in. (254 µm).
Exception: Unless otherwise approved.
SUBSTANTIATION: Apart from the exception in 501-4(b) the current version of the Code does not give any guidance on wiring for nonincendive field wiring circuits. An examination of nonincendive field wiring takes into consideration the faults of opening, shorting, and grounding of the field wiring. When applied to multiple conductor applications such as programmable logic controllers [PLCs] this type of approach can lead to output parameters for the devices which render them unusable. The current version of the Code requires the examination to include situations which, cannot be determined by the manufacturer of the

equipment or an NRTL. The installer could determine these parameters but how many would actually consider these in the case where multiple nonincendive circuits are run in a single cable. The situation is similar to that for intrinsically safe wiring, and the proposed text is based on that in Article 504-30.
PANEL ACTION: Reject.
PANEL STATEMENT: See Proposal 14-84.

(Log #4239)

14- 220 - (502-4(b), Exception): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise by deleting the word "ordinary" and replacing it with the word "unclassified."
SUBSTANTIATION: This is the technically correct term. This was proposal 14-208 in the prior cycle, one of four proposals that the panel accepted in the ROP, forgot about, and inadvertently wiped out through unrelated editorial activity in the comment period.
PANEL ACTION: Accept in Principle.
The definition of "ordinary" has been modified to "nonhazardous". See Proposal 14-2a.
In Exception No. 1 to 502-4(b), after the word "locations", add the words "including Chapter 7 and 8 wiring methods."
PANEL STATEMENT: Proposal 14-2a addresses this issue. The added words correlate with Article 501 requirements.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: The panel action should be "Accept". See my comments on Proposal 14-2a.
GOODMAN: The proposal should be "Accept" and not "Accept in Principle". The Panel Action is contrary to the submitter's intent and justification with respect to the term "Unclassified" as a replacement for "Nonhazardous". The correct term is "unclassified". Also see detailed comment under Proposal 14-2a.

(Log #2389)

14- 221 - (502-4(b)(1)): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 14-222. This action will be considered by the Panel as a Public Comment.
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise the heading and first sentence as shown below:
(1) ~~Wireways,~~ Fittings, and Boxes. ~~Wireways, f~~Fittings, and boxes in which taps. (balance unchanged)
SUBSTANTIATION: 502-4(b) requires dusttight wireways in Class II, Division 2. Present wording of (1) conflicts with that requirement by permitting wireways "designed to minimize the entrance of dust," which are not necessarily dusttight under the Article 100 definition of that term.
PANEL ACTION: Accept.
PANEL STATEMENT: See Proposal 14-222.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

(Log #2390)

14- 222 - (502-4(b)(1)): Accept in Principle
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise as shown below:
(1) Wireways, Fittings, and Boxes. Wireways, fittings, and boxes ~~in which taps, joints, or terminal connections are made~~ shall be designed to minimize the entrance of dust. (balance unchanged)
SUBSTANTIATION: A Class II location can be extremely dusty without being Division 1, resulting in dust buildup within enclosures that do not adequately minimize the entrance of dust. The present language does not address fittings and boxes without taps, joints, or terminal connections, and therefor permits standard stamped metal boxes and covers with multiple KO punchings and numerous small holes. This is inconsistent with Section 502-4(b), which requires dusttight wireways in Class II, Division 2, and Section 503-3(a) and (b), which require dusttight boxes and fittings in Class III locations, without regard to taps, joints, or terminal fittings.
PANEL ACTION: Accept in Principle.
Revise 502-4(b)(1) to read: "(1) Boxes and Fittings. All boxes and fittings shall be dust-tight."
PANEL STATEMENT: This more effectively meets the intent of the submitter.

(Log #1605)

14- 223 - (502-6(a)(1)): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
(1) Type Required. Switches, circuit breakers, motor controllers, and fuses, including pushbuttons, relays, and similar devices that are intended to interrupt current during normal operation or that are installed where combustible dusts of an electrically conductive nature may be present, shall be provided with ~~approved~~ (identified) dust-ignitionproof enclosures.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

(Log #1606)

14- 225 - (502-6(a)(3)): Accept in Principle
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
(3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers, and circuit breakers shall have enclosures specifically ~~approved~~ (identified) for such locations.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Principle.
Replace "approved" with "identified" and delete the word "specifically".
PANEL STATEMENT: This word implies a higher level of identification which is not intended by Panel 14. Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #3539)

14- 244 - (502-11(a)(3)): Accept in Principle
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise the fourth sentence to read as follows:
"Where wiring between an outlet box or fitting and a pendant fixture is not enclosed in conduit, flexible cord ~~approved~~ (identified) for hard usage shall be used, and suitable seals shall be provided where the cord enters the fixture and the outlet box or fitting. Flexible cord shall not serve as the supporting means for a fixture."
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept in Principle.
Change "approved" to "listed".
PANEL STATEMENT: Listed extra-hard and hard usage cord is readily available.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #2387)

14- 257 - (502-12, Exception (New)): Accept in Principle
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Add the following Exception:
Exception: Flexible cord approved for hard usage shall be permitted between an outlet box or fitting and a pendant fixture, as provided by Sections 502-11(a)(3) and 502-11(b)(4).
SUBSTANTIATION: The present requirement of this section for the use of extra-hard usage cord in Class II locations conflicts with those that permit hard-usage flexible cord for fixture pendants under Sections 502-11(a)(3) and 502-11(b)(4).
PANEL ACTION: Accept in Principle.
Add an exception to 502-12(1) to read: "Flexible cord listed for hard usage as permitted by Sections 502-11(a)(3) and (b)(4)."
PANEL STATEMENT: The panel's version simplifies the langauge and inserts the exception in the correct location in code.

(Log #1614)

14- 268 - (502-14(a)(5)): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
Where dusts are of a combustible, electrically conductive nature, all wiring and equipment shall be ~~approved~~ (identified) for Class II locations.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

(Log #2388)

14- 273 - (502-16(a)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise as shown below:
(a) Bonding. Standard locknuts or bushings ~~The locknut-bushing, and double-locknut types of contacts~~ shall not be depended on for bonding purposes~~, but bonding jumpers with proper fittings or other approved means of bonding shall be used~~; bonding shall comply with Sections 250-100 and 250-94. (Balance of paragraph and exception unchanged)
~~FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.~~
SUBSTANTIATION: Present wording conflicts with Section 250-94, which is referenced by Section 250-100. Taken literally, it does not require bonding for standard locknuts that are employed to secure threadless connectors to enclosures, nor around concentric or eccentric knockouts that may not be suitable for bonding, as required under Section 250-94. May also be interpreted to prohibit the use of bonding locknuts and bushings, which are acceptable under Section 250-94. (The balance of this paragraph and the exception are also unnecessary if submitter's proposal for Section 250-100 is accepted).
PANEL ACTION: Reject.
PANEL STATEMENT: These requirements are more stringent than those in Article 250.

ARTICLE 503 — CLASS III LOCATIONS

(Log #1261)

14- 275 - (503): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: In 503-7, change "0.021 in. (533 µm)" to "0.53 mm (0.021 in.)".
In 503-9(c), change "12 in. (305 mm)" to "300 mm (12 in.)" in three places.
In 503-16(b), Exception (a), change "6 ft (1.83 m)" to "1.8 m (6 ft)".
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Reject.
PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

(Log #2852)

14- 280 - (503-3(b)): Reject
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: Revise as follows:
Exception No 2: Nonincendive field wiring shall be permitted using any of the methods suitable for wiring in ordinary locations.
Separation of Nonincendive Field Wiring Conductors
(a) From Nonincendive Field Wiring Conductors.
(3) Open Wiring. Conductors and cables of nonincendive field wiring circuits not in raceways or cable trays shall be separated at least 1.97 in. (50 mm) and secured from conductors and cables of any other wiring.
Exception: Where either (1) all of the nonincendive field wiring circuit conductors are in Type MI or MC cables or (2) all of the other circuit conductors are in raceways or Type MI or MC cables where the sheathing or cladding is capable of carrying fault current to ground.
(4) In Raceways, Cable Trays, and Cables. Conductors of nonincendive field wiring circuits shall not be placed in any raceway, cable tray, or cable with conductors of any other wiring.
Exception No. 1: Where conductors of nonincendive field wiring circuits are separated from conductors of incendive field wiring circuits by a distance of at least 1.97 in. (50 mm) and secured, or by a grounded metal partition or an approved insulating partition.
FPN: No. 20 gauge sheet metal partitions 0.0359 in. (912 µm) or thicker are generally considered acceptable.
Exception No. 2: Where either (1) all of the nonincendive field wiring circuit conductors or (2) all of the other wiring conductors are in grounded metal-sheathed or metal-clad cables where the sheathing or cladding is capable of carrying fault current to ground.
FPN: Cables meeting the requirements of Articles 330 and 334 are typical of those considered acceptable.
(3) Within Enclosures.
a.) Conductors of nonincendive field wiring circuits shall be

separated at least 1.97 in. (50 mm) from conductors of any other field wiring, or as specified in Section 503-(?)(a)(2).

b.) All conductors shall be secured so that any conductor that might come loose from a terminal cannot come in contact with another terminal.

FPN No. 1: The use of separate wiring compartments for the nonincendive field wiring and other field wiring terminals is the preferred method of complying with this requirement.

FPN No. 2: Physical barriers such as grounded metal partitions or approved insulating partitions or approved restricted access wiring ducts separated from other such ducts by at least ≤ in. (19 mm) can be used to help ensure the required separation of the wiring.

(b) From Different Nonincendive Field Wiring Circuit Conductors. Different nonincendive field wiring circuits shall be in separate cables or shall be separated from each other by one of the following means.

1. The conductors of each circuit are within a grounded metal shield.

2. The conductors of each circuit have insulation with a minimum thickness of 0.01 in. (254 µm).

Exception: Unless otherwise approved.

SUBSTANTIATION: Apart from the exception in 501-4(b) the current version of the Code does not give any guidance on wiring for nonincendive field wiring circuits. An examination of nonincendive field wiring takes into consideration the faults of opening, shorting, and grounding of the field wiring. When applied to multiple conductor applications such as programmable logic controllers [PLCs] this type of approach can lead to output parameters for the devices which render them unusable. The current version of the Code requires the examination to include situations which, cannot be determined by the manufacturer of the equipment or an NRTL. The installer could determine these parameters but how many would actually consider these in the case where multiple nonincendive circuits are run in a single cable. The situation is similar to that for intrinsically safe wiring, and the proposed text is based on that in Article 504-30. ANSI/ISA S12.12:1994 has requirements which make no distinction between Class.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel believes that there is no technical justification given for separatiion of conductors above what is required in nonhazardous locations.

(a) Power Supply. Power supply to contact conductors shall be electrically isolated from all other systems and ungrounded, and shall be equipped with an acceptable ground detector that will give an alarm... (remainder unchanged).
SUBSTANTIATION: Editorial. "Isolated" while perhaps understood does not specifically mean ungrounded. Separately derived systems from isolating or isolated secondaries of transformers are required to be grounded by certain Code sections, and ungrounded by some sections. Sections 668-20(b) and 668-21(a) for example clearly specify an ungrounded secondary, which is apparently the intent.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes the present text is clear.

(Log #1794)

14- 290 - (503-14): Accept
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Revise the second sentence to read as follows:
"The rooms shall be constructed to prevent the entrance of ignitable amounts of flyings or lint and shall be well ventilated."
SUBSTANTIATION: The present language is unclear as to what is to be prevented. Either the entrance or accumulation of ignitable amounts is probably intended but neither requirement is stated.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #1623)

14- 291 - (503-16(a)): Reject
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise first sentence to read as follows:
The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other ~~approved~~ (identified) means of bonding shall be used.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: "Approved" is the correct word to describe the "means", "manner", or "methods" employed to accomplish something.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #2391)

14- 292 - (503-16(a)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for information.
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise as shown below:
(a) Bonding. Standard locknuts or bushings ~~The locknut-bushing, and double locknut types of contacts~~ shall not be depended on for bonding purposes~~, but bonding jumpers with proper fittings or other approved means of bonding shall be used~~; bonding shall comply with Sections 250-100 and 250-94. (Balance of paragraph and exception unchanged)
~~FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.~~
SUBSTANTIATION: Present wording conflicts with Section 250-94, which is referenced by Section 250-100. Taken literally, it does not require bonding for standard locknuts that are employed to secure threadless connectors to enclosures, nor around concentric or eccentric knockouts that may not be suitable for bonding, as required under Section 250-94. May also be interpreted to prohibit the use of bonding locknuts and bushings, which are acceptable under Section 250-94. (The balance of this paragraph and the exception are also unnecessary if submitter's proposal for Section 250-100 is accepted).
PANEL ACTION: Reject.
PANEL STATEMENT: These requirements are more stringent than those in Article 250.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

ARTICLE 504 — INTRINSICALLY SAFE SYSTEMS

(Log #1262)

14- 294 - (504): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: In 504-30(a)(1), change "1.97 in. (50 mm)" to "50 mm (2 in.)".
In 504-30(a)(2), Exception, change "1.97 in. (50 mm)" to 50 mm (2 in.)".
In 504-30(a)(2), Exception, FPN, change "0.0359 in. (912 µm)" to "0.91 mm (0.0359 in.)".
In 504-30(a)(3)(a), change "1.97 in. (50 mm)" to "50 mm (2 in.)".
In 504-30(a)(3)(b), FPN No. 2, change "3/4 in. (19 mm)" to "19 mm (3/4 in.)".
In 504-30(b)(2), change "0.01 in. (254 µm)" to "0.25 mm (0.01 in.)."
In 504-80(b), change "25 ft (7.62 m)" to "7.5 m (25 ft)".
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Reject.
PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
KUCZKA: See my Explanation of Negative Vote on Proposal 14-10.
OMEARA: The proposal should be accepted, to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.
ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #CP1406)

14- 294a - (504-2): Accept
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. The Technical Correlating Committee further directs that the action on this Proposal be rewritten to comply with the NEC Style Manual, with respect to the use of mandatory language in Fine Print Notes. This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 14
RECOMMENDATION: Replace existing definition of "simple apparatus" with the following:
"An electrical component or combination of components of simple construction with well-defined electrical parameters which does not generate more than 1.5 volt, 100 milliamps and 25 milliwatts, or a passive component which does not dissipate more than 1.3 watts and which is compatible with the intrinsic safety of the circuit in which it is used.
FPN 1: The following apparatus are examples of simple apparatus: a) passive components, for example switches, junction boxes,

resistance temperature devices and simple semiconductor devices such as LED's;
b) sources of generated energy, for example thermocouples and photocells, which do not generate more than 1.5 V, 100 mA and 25 mW.
FPN 2: Simple apparatus should conform to all relevant requirements of ANSI/UL913 but need not be listed. In particular, the following aspects should always be considered.
a) simple apparatus should not achieve safety by the inclusion of voltage and/or current limiting and/or suppression devices;
b) simple apparatus should not contain any means of increasing the available voltage or current, for example circuits for the generation of ancillary power supplies;
c) when simple apparatus is located in the hazardous location, it should be temperature classified. When used in an intrinsically safe circuit within their normal rating and at a maximum ambient temperature of 40°C switches, plugs and sockets and terminals are allocated a T4 temperature classification for Class I Division 1 Group A, B, C, and D or Class I Zone 1 Group IIC applications. Where simple apparatus forms part of an apparatus containing other electrical circuits, the whole should be listed.
FPN 3 - Sensors which utilise catalytic reaction or other electro-chemical mechanisms are not normally simple apparatus. Specialist advice on their application should be sought."
SUBSTANTIATION: The 1999 Edition of IEC 60079-11 defines simple apparatus as
3.11 simple apparatus
An electrical component or combination of components of simple construction with well-defined electrical parameters which is compatible with the intrinsic safety of the circuit in which it is used.
This is then amplified by the following clause.
5.4 Simple apparatus
The following apparatus shall be considered to be simple apparatus:
a) passive components, for example switches, junction boxes, resistors and simple semiconductor devices;
b) sources of stored energy with well defined parameters, for example capacitors or inductors, whose values shall be considered when determining the overall safety of the system;
c) sources of generated energy, for example thermocouples and photocells, which do not generate more than 1,5 V, 100 mA and 25 mW. Any inductance or capacitance present in these sources of energy shall be considered as in b).
Simple apparatus shall conform to all relevant requirements of this standard but need not be certified and need not comply with clause 12. In particular, the following aspects shall always be considered.
a) simple apparatus shall not achieve safety by the inclusion of voltage and/or current limiting and/or suppression devices;
b) simple apparatus shall not contain any means of increasing the available voltage or current, for example circuits for the generation of ancillary power supplies;
c) where it is necessary that the simple apparatus maintains the integrity of the isolation from 'earth' of the intrinsically-safe circuit, it shall be capable of withstanding the test voltage to earth in accordance with 6.4.12. Its terminals shall conform to 6.3.1;
d) non metallic enclosures and enclosures containing light metals when located in the hazardous area shall conform to 7.3 and 8.1 of IEC 60079-0, 1998;
e) when simple apparatus is located in the hazardous area, it shall be temperature classified. When used in an intrinsically safe circuit within their normal rating and at a maximum ambient temperature of 40°C switches, plugs and sockets and terminals are allocated a T6 temperature classification for Group II applications and considered as having a maximum surface temperature of 85°C for Group I applications. Other types of simple apparatus shall be temperature classified in accordance with clauses 4 and 6 of this standard.
Where simple apparatus forms part of an apparatus containing other electrical circuits, the whole shall be certified.
NOTE - Sensors which utilize catalytic reaction or other electro-chemical mechanisms are not normally simple apparatus. Specialist advice on their application should be sought.
In the past, no technical justification has been available from the IEC for the change from the previous definition of 1.3 volts, 0.1 ampere, 25 milliwatts, or 20 microjoules. [I don't know why there is the difference between the US (1.2V) and IEC (1.3V) voltages] The original choice of 1.2 V was, I believe, made in the UK in the 1960's. It was possibly chosen because it was 10% of the 12 volt threshold voltage of hydrogen and unlikely to cause a serious degradation of the safety of an intrinsically safe circuit. The 1.3 V was introduced by CENELEC in 1977 with the publication of the 1st edition of EN50020. A proposal was accepted for the 1994 2nd edition of EN 50020 to change the parameters for simple apparatus. The arguments in favor of changing the definition are that the 1.2 volt limit excludes the use of some silicon solar cells and the possibility of using two silicon diodes in series to suppress the output from a circuit. This combination is frequently used to create apparatus, which although certified has input parameters equivalent to simple apparatus.
The relaxation permits some single cell batteries theoretically but the 25mW/100mA restriction confines the available choice to a very restricted few.
The original 20 mJ requirement is difficult to defend. Adding 20 mJ to a Group A, B circuit, which may be already near its limits, could remove the safety factor of 1.5; yet it is arguably restrictive in Class I Group C, D. It seems reasonable to take into account the known capacitance and inductance since this adequately ensures safety and is accepted practice for cables.
If it is retained, the 20 mJ should have an associated time. A thermocouple producing 10 mV and 1 mA generates 20 microjoules in 2 seconds and hence is excluded by this requirement. 25 mW requires 800 mS and 100 mA and 1.2 V 167 mS.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban
COMMENT ON AFFIRMATIVE:
COOK: I agree with the definition, but have concerns about FPN 2 and FPN 3. FPN 2 contains information that borders on being requirements which are prohibited from being located in a FPN. The second sentence in FPN 3 causes me great concern. As an authority having jurisdiction, I am not sure who would qualify as a specialist, and I am not sure about equipment that I need to seek a specialist for its application.
JAGUNICH: See ballot for David Wechsler.

(Log #3564)

14- 295 - (504-2): Accept
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise the third paragraph to read as follows:
"Different intrinsically safe circuits are intrinsically safe circuits in which the possible interconnections have not been evaluated and ~~approved~~ (identified) as intrinsically safe."
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #1945)

14- 309 - (504-30(2) Exception No. 1): Reject
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise as follows:
Exception No. 1: Where conductors of intrinsically safe circuits are separated from conductors of nonintrinsically safe circuits by a distance of at least 1.97 in. (50 mm) and secured, or by a grounded metal partition or an ~~approved~~ (identified) insulating partition.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: "Approved" is the appropriate word to use in this context.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I disagree with both the proposal and the Panel Action. I agree that an insulating partition would not be identified, however the term "approved" should be deleted. Partitions are not means, methods or manners that need some special attention. I do not believe any additional approval, other than required by 110-2, is needed.

(Log #3561)

14- 310 - (504-30(a)(2) Exception No. 1): Reject
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise the Exception to read as follows:
Exception No. 1: Where conductors of intrinsically safe circuits are separated from conductors of nonintrinsically safe circuits by a distance of at least 1.97 in. (50 mm) and secured, or by a grounded metal partition or an ~~approved~~ (identified) insulating partition.
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: "Approved" is the appropriate word to use in this context.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative Vote on Proposal 14-309.

(Log #1944)

14- 311 - (504-30(a)(3)(b), FPN No. 2): Reject
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
FPN No. 2: Physical barriers such as grounded metal partions or ~~approved~~ (identified) insulating partitions or ~~approved~~ (identified) restricted access wiring ducts separated from other such ducts by at least 3/4 in. (19 mm) can be used to help ensure the required separation of the wiring.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: "Approved" is the appropriate word to use in this context.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: See negative comment on Proposal 14-310 for partitions. Restricted access wiring ducts are certainly identified and available with listings from many manufacturers under category (ZOYX) in the UL Green Book.

(Log #3562)

14- 312 - (504-30(a)(3)(b), FPN No. 2): Reject
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise the fine print note to read as follows:
FPN No. 2: Physical barriers such as grounded metal partitions or ~~approved~~ (identified) insulating partitions or ~~approved~~ (identified) restricted access wiring ducts separated from other such ducts by at least 3/4 in. (19 mm) can be used to help ensure the required separation of the wiring.
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: "Approved" is the appropriate word to use in this context.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative Vote on Proposal 14-311.

(Log #1943)

14- 313 - (504-30(b), Exception): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise as follows:
Exception: Unless otherwise ~~approved~~ (identified).
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.
COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #3563)

14- 314 - (504-30(b), Exception): Accept
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise the Exception to read as follows:
Exception: Unless otherwise ~~approved~~ (identified).
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #922)

14- 315 - (504-60(b)): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) ~~Nonhazardous~~ unclassified locations in unclassified ~~nonhazardous~~ locations where metal raceways, cables, cable trays, or auxiliary gutters are used for intrinsically safe system wiring and extended into hazardous (classified) locations ~~associated apparatus shall be bonded~~ bonding shall be in accordance with sections 501-16(a); 502-16(a); 503-16(a); or 505-25 as applicable.
SUBSTANTIATION: The proposal is intended for clarification of intent. Nonhazardous and hazardous are not specific per code intent and can literally apply to locations not related to classified or unclassified locations. Bonding should not be limited to raceways and apparatus which is not defined.
PANEL ACTION: Accept in Principle in Part.
Revise 504-60(b) to read: "(b) Unclassified or Nonhazardous Locations. In unclassified or nonhazardous locations . . .hazardous (classified) locations . . ."
PANEL STATEMENT: This implements the new definitions accepted under Proposal 14-352. The additional text was not accepted because cable trays and auxiliary gutters are covered elsewhere in the code and cables do not require bonding.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: The panel action should be "Accept in Part". See my comments on Proposal 14-2a for use of the term "unclassified."
GOODMAN: This proposal should be "Accept in Part" and not "Accept in Principle in Part". The Panel Action is contrary to the submitter's intent and justification with respect to the term "Unclassified" as a replacement for "Nonhazardous". The correct term is "unclassified". Also see detailed comments under Proposal 14-2a.

(Log #2135)

14- 316 - (504-60(b)): Accept in Principle in Part
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Replace "nonhazardous" with "unclassified" in 2 places.
SUBSTANTIATION: This is a companion to other proposals which provide a definition of unclassified in Articles 100, 500, and 505, and provides correlation. The term "Classified" refers to the type of material/hazard potential involved, i.e., Class I, Division 1, Class II, Division 2, etc. Terms such as nonhazardous and unclassified are used in both the NEC, the Uniform Building Code (UBC) and other NFPA documents. The term nonhazardous infers that the area has "no" hazards while the term "unclassified" more clearly correlates with the condition of being reviewed but found not to need classification. This action provides needed correlation with other NFPA documents, such as NFPA 497. Additionally the term "nonhazardous" is used 7 times within various parts of the NEC and in at least one place in the NEC the meaning of nonhazardous applies to voltages and not classification. A companion proposal has been made to change the term "nonhazardous" to "unclassified" as appropriate elsewhere in the NEC.
PANEL ACTION: Accept in Principle in Part.
PANEL STATEMENT: The action on Proposal 14-315 addresses these issues.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: The panel action should be "Accept". See my comments on Proposal 14-2a.
GOODMAN: This proposal should be "Accept" and not "Accept in Principle". The Panel Action is contrary to the submitter's intent and justification with respect to the use of the terms "Unclassified" and "Nonhazardous". This proposal along with the other companion proposals referenced in the submitter's substantiation are designed to remove the term "nonhazardous" from the NEC, not add and define the term. Also see additional comments under Proposal 14-318a.

(Log #2392)

14- 317 - (504-80(b)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise as shown below:
(b) Wiring. Raceways, cable trays, and ~~open wiring~~ cables. (balance unchanged)
SUBSTANTIATION: "Open wiring" (unless the intent is open wiring on insulators) is not one of the wiring methods "suitable for unclassified locations" which Section 504-20 requires to be used for intrinsically safe circuits. "Cables" seems more appropriate.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes that 504-30(a)(1) allows cables to be run as open wiring.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I agree with the submitter's proposal and substantiation.

(Log #4014)

14- 318 - (504-80(b)): Reject
SUBMITTER: Christopher Pharo, Rep. IBEW
RECOMMENDATION: This proposal is to revise part (b) to read as follows:
Article 504-80(b) Wiring. Raceways, cable trays, and open wiring for intrinsically safe system wiring shall be identified with permanently affixed labels with the wording "WARNING-Instrinsic Safe Wiring-Keep all wiring methods 2 in. away". The labels shall be so located so as to be visible after installation and placed so that they may be readily traced through the entire length of the installation. Spacing between labels shall not be more than 10 ft.
SUBSTANTIATION: There is never a problem installing an intrinsic safe system initially. However, chances are, the next electrician, data technician, maintenance worker, or telephone technician will not know what an intrinsic safe system is. With this in mind, it would be reasonable to expect these people would not be aware of any special requirements that this system is subject to.
Previous code panels have amended certain warning signs to include some type of command as well as a warning or danger. A simple sign that reads as follows: "DANGER-HIGH VOLTAGE" was subsequently changed to "DANGER-HIGH VOLTAGE-KEEP OUT". An accident probably occurred in the above example and that is why a simple command is now included.
The simple labeling of the cables in a intrinsically safe system is not adequate. The label should include some type of warning, some type of identification as to the hazard, and then finally some type of direction or command. Most workers would not be familiar enough with this wiring system to know that they have to stay at least 2 in. away with their own wiring method. A label identified as "WARNING-Intrinsic Safe Wiring-Keep all wiring methods 2 in. away" would meet this criteria.
The distance of 25 ft is inadequate. When an installer or technician runs their cables above a drop ceiling, it is usually very dark. The distance that one can see above a dark drop veiling is limited, probably to no more than 10 ft. By placing a 10 ft maximum distance between labels, this would assure future installers of a possible hazard yet it would also aid them in their installation.
I would think future installations in the areas around intrinsic safe wiring are difficult to police and would suggest that this type of labeling system may prevent confusion and limit liability.
PANEL ACTION: Reject.
PANEL STATEMENT: This is already addressed in 504-30.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I agree with the submitter's substantiation and do not believe that the additional labeling requirements would be an extreme burden on anyone.
WELDON: The submitter emphasizes that his concerns are not initial installations but rather what follows. This is especially true today as we find more and more inexperienced people doing various electrical upgrades, additions, teledata, and telecomm installations.
The code presently requires labeling intrinsically safe wiring with labels spaced not more than 25 feet that read, "intrinsic safety wiring". The submitter suggests that these labels should read, "Warning - intrinsic safe wiring - keep all wiring methods 2 inches away." He also suggests the space be reduced to 10 feet.
I believe this makes good sense. I regularly see various cables, conductors, and even raceways, haphazardly thrown or pushed through ceilings, strewn as though blown with a wind, literally tied in knots and twists; intertwined like spaghetti running in all directions. Increased warning may at least raise the consciousness of inexperienced under trained people to the possibility of needed caution.

ARTICLE 505 — CLASS I, ZONE 0, 1, AND 2 LOCATIONS

(Log #1263)

14- 319 - (505): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: **In 505-3(b), change the first sentence to read:**
"**All threaded conduit referred to herein shall be threaded with an NPT standard conduit cutting die that provides ~~3/4 in.~~ a taper of 1 in 16 ~~per foot.~~**"
In 505-15(a)(2), change "10 ft (3.05 m)" to "3.0 m (10 ft)".
In 505-15(a)(2), Exception, change "12 in. (305 mm)" to "300 mm (12 in.)".
In Table 505-15, reverse the order of columns for "in." and "mm" as shown below.

Table 505-15. Minimum Distance of Obstruction from Flameproof "d" Flange Openings

	Minimum Distance	
Gas Group	mm	in.
IIC	40	1 37/64
IIB	30	1 3/16
IIA	10	25/64

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Reject.
PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
KUCZKA: See my Explanation of Negative Vote on Proposal 14-10.
OMEARA: The proposal should be accepted, to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.
ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #CP1402)

14- 318a - (505): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. Further, it was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel, with further consideration given to the comments expressed in the voting, specifically with respect to comments that the accepted Proposal does not accurately reflect what was agreed upon by the Panel. It is the understanding of the Technical Correlating Committee that this proposal is modified by Proposals 14-323, 14-324, 14-325, 14-326 14-327, 14-328, 14-329, 14-330, 14-331, 14-334, 14-335, 14-336, 14-338, 14-339, 14-340, 14-341, 14-342, 14-344, 14-345, 14-346, 14-349, 14-350, 14-352, 14-354, 14-355, 14-356, 14-357, 14-358, 14-359, 14-360, 14-361, 14-365, 14-366, 14-368, 14-369, 14-370, 14-371, 14-372, 14-374, and 14-375. This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 14
RECOMMENDATION: Revise Article 505 to read as shown:
ARTICLE 505 -- Class I, Zone 0, 1, and 2 Locations
505-1. Scope
This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 500 for electrical and electronic equipment and wiring

for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases, vapors, or liquids.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; and Class III, Division 1 or Division 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 500 through 504.

505-2 Definitions. For purposes of this article, the following definitions apply.

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where prescribed in a particular Code requirement.

FPN: Suitability of equipment for a specific purpose, environment, or application may be determined by:

3. equipment listing or labeling;

2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or

3. other evidence acceptable to the authority having jurisdiction such as a manufacturer's self evaluation or an owner's engineering judgment.

(See definitions of *Labeled* and *Listed*)

Unclassified Locations. Locations that have been evaluated by the classification process defined in Section 500-~~3~~5(a) or Section 505-~~3~~5 (a) and determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.

Nonhazardous Locations. Locations which are not required to have been evaluated by the process defined in 500-~~3~~5 (a) or 505-~~3~~5 (a).

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with an electrical installation, as well as any portable or transportable device having a battery or other electrical power source. (14-6)

Flameproof. Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

FPN: See Electrical Apparatus for Use In Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection — Flameproof "d," ISA S12.22.01-1996; Electrical Apparatus for Explosive Gas Atmospheres, Part 1 — Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus, IEC 79-1-1990 and Amendment No. 1 (1993).

Purged and Pressurized. Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

FPN No. 1: See Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

FPN No. 2: See Electrical Apparatus for Explosive Gas Atmospheres - Part 2: Electrical Apparatus, Type of Protection "p," IEC 79-2-1983; and Electrical Apparatus for Explosive Gas Atmospheres - Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization, IEC 79-13-1982.

Intrinsic Safety. Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

FPN No. 1: See Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations, ANSI/UL 913-1997; Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Intrinsic Safety "i," IEC 60079-11-1999.

FPN No. 2: Intrinsic safety is designated type of protection "ia" by IEC 79-11 for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" by IEC 79-11 for use in Zone 1 locations.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe equipment ("ia" or "ib" respectively), but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Type of Protection "n." Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

FPN: see Electrical Apparatus for Explosive Gas Atmospheres, Part 15 — Electrical Apparatus with Type of Protection "n," IEC 79-15-1987.

Oil Immersion "o." Type of protection where electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Oil-Immersion "o," ISA S12.26.01 — 1996; and Electrical Apparatus for Explosive Gas Atmospheres, Part 6 — Oil-Immersion "o," IEC 79-6-1995.

Increased Safety "e." Type of protection where electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Increased Safety "e," ISA S12.16.01-1996; and Electrical Apparatus for Explosive Gas Atmospheres — Part 7: Increased Safety "e," IEC 79-7-1990, Amendment No. 1 (1991), and Amendment No. 2 (1993).

Encapsulation "m." Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Encapsulation "m," ISA S12.23.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m," IEC 79-18-1992.

Powder Filling "q." Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Powder Filling "q," ISA S12.25.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling, Type of Protection "q," IEC 79-5-1967.

505-~~3~~2. Other Articles

All other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

Exception: As modified by Article 504 and this article.

505-~~3~~4 General

(a) Documentation for Industrial Occupancies.

All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design,

install, inspect, maintain, or operate electrical equipment at the location.

FPN: For examples of area classification drawings, see Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 79-10-1995; Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, API RP 505-1997; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997; Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division I or Division 2, API RP 500-1997, Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

(b) Reference Standards.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association, the American Petroleum Institute, and the International Society for Measurement and Control (ISA), that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.
FPN No. 2: For further information on the classification of locations, see Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 79-10-1995; Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, ANSI/ API RP 505-1997~~6~~; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.
FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.
FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996, and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2, API RP 500-1997, Section 6.3.
FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassifed and Class I, Zone 0, Zone 1, and Zone 2 Locations~~Production Platforms~~, ANSI/API RP 14F~~Z~~-2000~~1991~~.
FPN No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see Electrical Apparatus for Explosive Gas Atmospheres — Part 14: Electrical Installations in Explosive Gas Atmospheres (Other than Mines), IEC 79-14-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 16: Artificial Ventilation for the Protection of Analyzer(s) Houses, IEC 79-16-1990.

505-~~4~~5 Classifications of Locations

(a) Classification of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified.
Each room, section, or area shall be considered individually in determining its classification.

FPN No. 1: See Section 505-~~6~~7 for restrictions on area classification.
FPN No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location ~~less hazardous or in nonhazardous locations~~ and, thus, to reduce the amount of special equipment required.

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations.

FPN: For further information regrading classification and ventilaton of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989 (14-39)

(b) Class I Zone Locations.
Class I Zone locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I Zone locations shall include those specified in (1), (2) and (3).

(1) Class I, Zone 0. A Class I, Zone 0 location is a location
(a) In which ignitible concentrations of flammable gases or vapors are present continuously, or
(b) In which ignitible concentrations of flammable gases or vapors are present for long periods of time.

FPN No. 1: As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2, API RP 505-1996; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous Areas, IEC 79-10-1995; and Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum; and Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997.
FPN No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.
FPN No. 3: It is not good practice to install electrical equipment in Zone 0 locations except when the equipment is essential to the process or when other locations are not feasible. [See Section 505-3(a) FPN No. 2.] If it is necessary to install electrical systems in a Zone 0 location, it is good practice to install intrinsically safe systems as described by Article 504.

(2) Class I, Zone 1. A Class I, Zone 1 location is a location
(a) In which ignitible concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
(b) In which ignitible concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
(c) In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitible concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
(d) That is adjacent to a Class I, Zone 0 location from which ignitible concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: Normal operations is considered the situation when plant equipment is operating within its

design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seats and flange gaskets, and spillage caused by accidents) are not considered normal operation.
FPN No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or easily ruptured containers; and other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operation, but not classified Zone 0.

(3) Class I, Zone 2. A Class I, Zone 2 location is a location
(a) In which ignitible concentrations of flammable gases or vapors are not likely to occur in normal operation and if they do occur will exist only for a short period; or
(b) In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used, but in which the liquids, gases, or vapors normally are confined within closed containers of closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or
(c) In which ignitible concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation, but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or
(d) That is adjacent to a Class I, Zone 1 location, from which ignitible concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used, but which would become hazardous only in case of an accident or of some unusual operating condition.

505-~~5~~6 Material Groups

For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in (a), (b), and (c).

FPN: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This Code does not apply to installations underground in mines. See Section 90-2(b).

Group II shall be subdivided into IIC, IIB, and IIA, as noted in (a), (b), and (c), according to the nature of the gas or vapor, for protection techniques "d," "ia," "ib," "[ia]," and "[ib]," and, where applicable, "n" and "o."

FPN No. 1: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in Construction and Verification Tests of Flameproof Enclosures of Electrical Apparatus, IEC 79-1A-1975, Amendment No. 1 (1993) and UL Technical Report No. 58 (1993). The test equipment for determining MIC is described in Spark-Test Apparatus for Intrinsically-Safe Circuits, IEC 79-3-1990. The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in Classification of Mixtures of Gases or Vapours with Air According to Their Maximum Experimental Safe Gaps and Minimum Igniting Currents, IEC 79-12-1978.

FPN No. 2: Verification of electrical equipment utilizing protection techniques "e," "m," "p," and "q," due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.

FPN No. 3: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

(a) Class I Zone Group Classifications. Class I Zone groups shall be as follows:

(1) Group IIC. Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or minimum igniting current ratio (MIC ratio) less than or equal to 0.45.

FPN: Group IIC is equivalent to a combination of Class I, Group A, and Class I, Group B, as described in Sections 500-5(a)(1) and (a)(2).

(2) Group IIB. Atmospheres containing acetaldehyde, ethylene, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either maximum experimental safe gap (MESG) values greater than 0.50 mm and less than or equal to 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.45 and less than or equal to 0.80.

FPN: Group IIB is equivalent to Class I, Group C, as described in Section 500-5(a)(3).

(3) Group IIA. Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experiment safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN: Group IIA is equivalent to Class I, Group D as described in Section 500-5(a)(4).

505-~~6~~7 Special Precaution
Article 505 requires equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.
FPN No. 2: Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by Section 505-4(a) may not be suitable for use at temperatures lower than -20ºC (-13ºF) unless they are approved for use at lower temperatures. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.

~~**(a) Supervision of Work.** Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer.~~ (14-348)

(~~a~~b) Dual Classification. In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

(~~b~~c) Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.

505-~~7~~8 Protection Techniques

The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

FPN: For additional information, see Electrical Apparatus for Use in Class I, Zone 0, 1 Hazardous (Classified) Locations General Requirements, ISA S12.0.01-1997; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279, 1997; and Electrical Apparatus for Explosive Gas Atmospheres - Part 0: General Requirements, IEC 79-0-1983, Amendment No. 1 (1987), and Amendment No. 2 (1991).

(a) Flameproof "d." This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(b) Purged and Pressurized. This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is approved.

(c) Intrinsic Safety. This protection technique shall be permitted for equipment in Class I, Zone 0 or Zone 1 locations for which it is approved.

(d) Type of Protection "n." This protection technique shall be permitted for equipment in Class I, Zone 2 locations. Type of protection "n" is further subdivided into nA, nC, and nR.

FPN: See Table 505-10(b) 1 for the descriptions of subdivisions for type of protection "n."

(e) Oil Immersion "o." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(f) Increased Safety "e." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(g) Encapsulation "m." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(h) Powder Filling "q." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

505-~~8~~9 Equipment

(a) Listing.
(1) Equipment that is listed for a Zone 0 location shall be permitted in a Zone 1 or Zone 2 location of the same gas or vapor. Equipment that is identified ~~listed~~ for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor.

(2) Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

FPN: One common example is equipment marked for "IIB + H2."

(b) Marking
Equipment shall be marked in accordance with (1) or (2).
(1) Division Equipment. Equipment identified ~~approved~~ for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with Section 500-~~5~~6(d), be permitted to be marked with the following:
a. Class I, Zone 1 or Class I, Zone 2 (as applicable), and
b. Applicable gas classification group(s) in accordance with Table 505-~~8~~9(b)(2), and
c. Temperature classification in accordance with Section 505-~~8~~9(3)

(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in Section 505-~~4~~5 shall be marked with the following in the order shown:
a. Class
b. Zone
c. Symbol "AEx"
d. Protection technique(s) in accordance with Table 505-~~8~~9(b)(2)
e. Applicable gas classification group(s) in accordance with Table 505-~~8~~9(b)(2)
f. Temperature classification in accordance with Section 505-~~8~~9(c)
Exception: Intrinsically safe associated apparatus shall be required to be marked only with (c), (d), and (e).

FPN No. 1: An example of such a required marking is "Class I, Zone 0, AEx ia IIC T6."
Electrical equipment of types of protection "e," "m," "p," or "q," shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "[ia]," or "[ib]" shall be marked Group IIA, or IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN No. 2: An explanation of the marking that is required follows.

Figure 505-~~8~~9(b)(1).

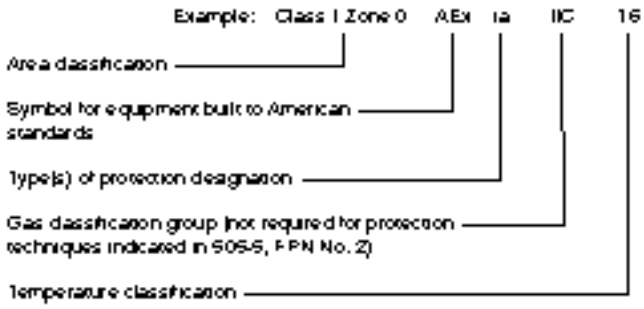

Table 505-~~8~~9(b)(1). Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated	Unclassified or Nonhazardous
	apparatus	
[ib]	Intrinsically safe associated	Unclassified or Nonhazardous
	apparatus	
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in	2
	which the contacts are	
	suitably protected other	
	than by restricted breathing	
	enclosure	
nR	Restricted breathing	2
	enclosure	
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

* Does not address use where a combination of techniques is used.

Table 505-~~8~~9(b)(2). Gas Classification Groups

Gas Group	Comment
IIC	See Section 505-6(a)
IIB	See Section 505-6(b)
IIA	See Section 505-6(c)

(c) Class I Temperature

The temperature marking shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994; and Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus, IEC 79-20-1996.

(1) Temperature Classifications. Approved equipment shall be marked to show the operating temperature or temperature ~~range~~ class referenced to a 40ºC (104ºF) ambient. The temperature ~~range~~class, if provided, shall be indicated using the temperature class (T Code) ~~in identification numbers, as~~ shown in Table 505-~~8~~9(c).

Table 505-~~8~~9(c). Classification of Maximum Surface Temperature for Group II Electrical Equipment

Temperature Class (T Code)	Maximum Surface Temperature (ºC)
T1	450
T2	300
T3	200
T4	135
T5	100
T6	85

Electrical equipment designed for use in the ambient temperature range between -20ºC and +40ºC shall require no additional temperature marking.
Electrical equipment that is designed for use in a range of ambient temperatures other than -20ºC and +40ºC is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol "Ta" or "Tamb" together with the special range of ambient temperatures. As an example, such a marking might be "-30ºC Ta + 40ºC."
Electrical equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature ~~range~~ class at that ambient temperature.
Exception No. 1: Equipment of the nonheat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature ~~range~~class.
Exception No. 2: Equipment approved for Class I, Division 1 or Division 2 locations as permitted by Sections 505-20(b) and (c) shall be permitted to be marked in accordance with Section 500-5 and Table 500-5(d).

(d) Threading
All threaded conduit referred to herein shall be threaded with an National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides _-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Threaded joints shall be made up with at least five threads fully engaged.

Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Threading specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1:1980, and Metric Screw Threads, ISO 965/3:1980.

505-15. Wiring Methods

(a) Zone 0. In Class I, Zone 0 locations, only the following wiring methods shall be permitted.

1. Intrinsically safe wiring in accordance with Article 504.
FPN: Article 504 only includes protection technique "ia."

2. Seals shall be provided within 10 ft (3.05 m) of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.

Exception: A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 12 in. (305 mm) beyond each boundary, shall not be required to be sealed, if the termination points of the unbroken conduit are in unclassified locations.

3. Seals shall be provided on cables at the first point of termination after entry into the Zone 0 location.
4. Seals shall not be required to be explosionproof or flameproof.

(b) Zone 1. In Class I, Zone 1 locations, all wiring methods permitted for Class I, Division 1 locations shall be permitted.

Where Class I, Division 1 wiring methods are used, sealing and drainage shall be provided in accordance with Sections 501-5(a), (c), (d), and (f), except where the term "Division 1" is used "Zone 1" shall be substituted.

An explosionproof seal, constructed in accordance with Section 501-5(c), shall be provided for each conduit entering an enclosure having type of protection "e" or "d," except where the type of protection "d" enclosure is marked to indicate that a seal is not required.

Wiring methods shall maintain the integrity of protection techniques.

FPN No. 1: For example, equipment with type of protection "e" requires that conduit seals or cable fittings incorporate suitable methods to maintain the "ingress protection" (minimum IP54) of the enclosure; and, for conduit, serve to maintain the explosionproof integrity of the conduit system.

FPN No. 2: Different electrical enclosures provide different degrees of "ingress protection." The measures applied to enclosures of electrical apparatus include
1. The protection of persons against contact with or approach to live parts and against contact with moving parts (other than smooth rotating shafts and the like) inside the enclosure;
2. The protection of the apparatus inside the enclosure against ingress of solid foreign bodies; and
3. The protection of the apparatus inside the enclosure against harmful ingress of water.

(c) Zone 2. In Class I, Zone 2 locations, all wiring methods permitted for Class I, Division 2 locations shall be permitted. Sealing and drainage shall be provided in accordance with Sections 501-5(b), (c), (e), and (f), except where the term "Division 2" is

used, "Zone 2" shall be substituted and where the term "Division 1" is used, "Zone 1" shall be substituted.

Wiring methods shall maintain the integrity of protection techniques.

(d) Solid Obstacles. Flameproof equipment with flanged joints shall not be installed such that the flange openings are closer than the distances shown in Table 505-15 to any solid obstacle that is not a part of the equipment (such as steelworks, walls, weather guards, mounting brackets, pipes, or other electrical equipment) unless the equipment is listed for a smaller distance of separation.

Table 505-15. Minimum Distance of Obstructions from Flameproof "d" Flange Openings

Gas Group	Minimum Distance In.	Minimum Distance Mm
IIC	1 37/64	40
IIB	1 3/16	30
IIA	25/64	10

505-16. Sealing and Drainage. Seals in conduit and cable systems shall comply with (a) through (e). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 505-16(c)(2)(b). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 505-16(d)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Zone 0. In Class I, Zone 0 locations, seals shall be located as follows.
(1) Seals shall be provided within 10 ft (3.05 m) of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.

Exception: A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 12 (305 mm) beyond each boundary, shall not be required to be sealed, if the termination points of the unbroken conduit are in unclassified locations.

(2) Seals shall be provided on cables at the first point of termination after entry into the Zone 0 location.

(3) Seals shall not be required to be explosionproof or flameproof.

(b) Zone 1. In Class I, Zone 1 locations, seals shall be located as follows.

(1) Conduit seals shall be provided for each conduit entering enclosures having type of protection 'd' or 'e'.

Exception: Where the enclosure having type of protection 'd' is marked to indicate that a seal is not required.

Conduit seals shall be provided for each conduit entering explosionproof equipment as follows.
(a) In each conduit entry into an explosionproof enclosure where either (1) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (2) the entry is 2-in. size or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.
Exception: Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are
1. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
2. Immersed in oil, or
3. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, approved for the location, and marked "factory sealed" or equivalent.
Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.

(b) Conduit seals shall be installed within 18 in. (457 mm) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

(c) Where two or more explosionproof enclosures for which conduit seals are required under (b)(2) are connected by nipples or by runs of conduit not more than 36 in. (914 mm) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 18 in. (457 mm) from either enclosure.

(3) In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.
FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.
FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(4) In each conduit run leaving a Class I, Zone 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 1 location.
Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Zone 1 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(5) Conduits containing cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 18 in. (457 mm) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

(6) Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (d).

(7) Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with (d).

(8) Cables shall be sealed at the point at which they leave the Zone 1 location.

Exception: Where cable is sealed at the termination point.

(c) Zone 2. In Class I, Zone 2 locations, seals shall be located as follows.

(1) Conduit seals shall be located as follows.

(a) For connections to enclosures that are required to be flameproof or explosionproof, a conduit seal shall be provided in accordance with (b)(1) and (b)(2). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section 505-16(b).

2. In each conduit run passing from a Class I, Zone 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Zone 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Zone 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Zone 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Zone 2 location into an unclassified location if the following conditions are met:

1. No part of the conduit system segment passes through a Class I, Zone 0 or Class I, Zone 1 location where the conduit contains unions, couplings, boxes, or fittings within 12 in. (305 mm) of the Class I, Zone 0 or Class I, Zone 1 location; and

2. The conduit system segment is located entirely in outdoor locations; and

3. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, and that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and

4. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and

5. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Zone 2 locations.

(2) Cable seals shall be located as follows.

(a) Cables entering enclosures required to be flameproof or explosionproof shall be sealed at the point of entrance. The seal shall comply with (d). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (b)(4).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(b) Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (2)(a). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [0.007 ft3/hour (198 cm3/hour) of air at a pressure of 6 in. of water (1493 pascals)].

FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

(c) Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (2)(a), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water (1493 pascals) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Zone 2 location without seals.

(d) Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Zone 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

FPN: The cable sheath may be either metal or a nonmetallic material.

(d) Class I, Zones 0, 1 and 2. Where required, seals in Class I, Zones 0, 1 and 2 locations shall comply with the following.

(1) Fittings. Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings for Class I locations shall be used. Sealing fittings shall be accessible. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

(2) Compound. The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF).

(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 5/8 in. (16 mm).
Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.

(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

(5) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically listed for a higher percentage of fill.

(e) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process or Service Connections, Etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend upon a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical conduit system, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the conduit system beyond the additional devices or means, if the primary seal fails.

The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above.

Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.

(14-368)

505-18. Conductors and Conductor Insulation.
1) For Type of Protection "e", field wiring conductors shall be copper. (14-365)
2) Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type approved for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means. (14-181)

505-19. Live Parts. There shall be no exposed live parts.(14-188)

505-20. Equipment

(a) Zone 0. In Class I, Zone 0 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception: Intrinsically safe equipment listed for use in Class I, Division 1 locations for the same gas, or as permitted by Section 505-7(d), and with a suitable temperature classification ~~rating~~ shall be permitted.

(b) Zone 1. In Class I, Zone 1 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception: Equipment approved for use in Class I, Division 1 or listed for use in Class I, Zone 0 locations for the same gas, or as permitted by Section 505-7(d) and with a suitable temperature classification ~~rating~~ shall be permitted.

(c) Zone 2 In Class I, Zone 2 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception No. 1: Equipment listed for use in Class I, Zone 0 or Zone 1 locations for the same gas, or as permitted by Section 505-7(d), and with a suitable temperature classification ~~rating~~, shall be permitted.

Exception No. 2: Equipment approved for use in Class I, Division 1 or Division 2 locations for the same gas, or as permitted by Section 505-7(d), and with a suitable temperature classification ~~rating~~ shall be permitted.

Exception No. 3: In Class I, Zone 2 locations, the installation of open or nonexplosionproof or nonflameproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Zone 2 location shall be permitted.

FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitible gases or vapors is suspected, clean air purging may be needed immediately prior to and during start-up periods.

(d) Manufacturer's Instructions. Electrical equipment installed in hazardous (classified) locations shall be installed in accordance with the instructions (if any) provided by the manufacturer.

505-2.Multiwire Branch Circuits. In a Class I, Zone 1 location, a multiwire branch circuit shall not be permitted.
Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously.

505-21. Increased Safety "e" Motors and Generators. In Class I, Zone 1 locations, Increased Safety "e" motors and generators of all voltage ratings shall be listed for Class I, Zone 1 locations, and shall comply with the following.
1. Motors shall be marked with the current ratio, IA/IN, and time, tE;
2. Motors shall have controllers marked with the model or identification number, output rating (horsepower or kilowatt), full-load amperes, starting current ratio (IA/IN), and time (tE) of the motors that they are intended to protect; the controller marking shall also include the specific overload protection type (and setting, if applicable) that is listed with the motor or generator;
3. Connections shall be made with the specific terminals listed with the motor or generator;
4. Terminal housings shall be permitted to be of substantial, nonmetallic, nonburning material provided an internal grounding means between the motor frame and the equipment grounding connection is incorporated within the housing;
5. The provisions of Part C of Article 430 shall apply regardless of the voltage rating of the motor;
6. The motors shall be protected against overload by a separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated in accordance with the listing of the motor and its overload protection;
7. Sections 430-34 and 430-44 shall not apply to such motors; and
8. The motor overload protection shall not be shunted or cut out during the starting period.

505-25. Grounding and Bonding. Grounding and bonding shall comply with Article 250 and the following additional requirements.
(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.
(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 505-15(c) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.
Exception: In Class I, Zone 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.

SUBSTANTIATION: This complete revision of Article 505 editorially revises the text to make it more easily understood and also incorporates numerous technical and editorial improvements made via other proposals.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban
COMMENT ON AFFIRMATIVE:
BRIESCH: While the Panel Action to accept the rewrite of Article 505 is supported, the NFPA-Circulated Panel Proposal does not include all of the changes agreed to at the meeting. The e-mail sent by Dave Wechsler subsequent to the meeting is more complete in reflecting the Panel Actions from the meeting regarding all but one issue. This e-mail includes changes to Section 505-9(a)(1), 505-20(b), and 505-20(c) that removed the requirement for listed equipment in Zone 1 and Zone 2 locations. These changes were not discussed and agreed to by the Panel at the meeting.
COOK: I agree with Proposal 14-318a and the substantiation, however, it does not incorporate all of the changes made via other proposals. An updated version that was emailed from Dave Wechsler on 1-26-2000 seems to be more complete with respect to including Panel Actions from the meeting in Hilton Head. The Wechsler versions do include changes in Sections 505-20(b) and (c) that change "listed" to "identified". That thought is completely different than the proposals to change "approved" to "identified". This is a much less restrictive requirement than the current NEC that was not discussed or voted on by the panel. I would be very opposed to this change. See my comments on Proposal 14-2a for use of the term "unclassified." Other changes seem to follow Panel Actions.
ENGLER: Not all of the changes made it into the draft circulated with this ballot, vote is to affirm the text with all of the necessary changes made to it.
GOODMAN: Generally, I agree with the format and arrangement changes. However, in the new Section 505-2 Definitions, the term "Nonhazardous" has been included. This comment recommends the removal of this term, definition, and use for the following reasons:
1. This term was added as part of the Panel Chairman assigned Task Group responsible for reorganizing the information in Article 505. This term and definition are new material and beyond the scope of the Panel Chair's direction.
2. The added term and definition was not part of any proposal made to the Panel and has no substantiation for its inclusion.
3. This term adds an additional area classification location that does not currently exist in related standards and practices (API 505 for example) or in most company documentation systems.
4. The term is misleading. The implication of "nonhazardous" is that there are no hazards. There are hazards other than electrical area classification such as caustics, acids, radiation, etc. Using the term "unclassified" is becoming widely accepted and recognized as specific to electrical area classification. "Nonhazardous" is much too broad.
5. The term is not needed. An area is either "Classified", requiring specifically identified or approved equipment suitable for the location or "Unclassified", not requiring equipment so identified or approved. The term will only add confusion and potential misapplication.
6. By its definition, "Nonhazardous Locations. Locations which are not required to have been evaluated". Whoever makes the determination that the location is not required to be evaluated has just evaluated the location. It is also not at all clear how or who would make that determination.
For the above reasons, the term "Nonhazardous", its definition and use should be removed from Article 505 (and 500).
JAGUNICH: See ballot for David Wechsler.
LAWRENCE: Due the the large number of public proposals received and acted upon, and also due to time constraints, the panel was not able to compile and correlate all aspects of the rewrites of the affected article. Please see David Wechsler's ballot.
OMEARA: Please see the comments on the ballot for David Wechsler.
WECHSLER: While attempts were made to provide NFPA Staff with corrected revisions of this text before the end of the CMP 14 panel meeting, a detailed review of this balloted draft versions has indicated that this does not correctly reflect the panel actions. Additionally, there is conflicting information in several panel action statements that indicates that this text applies to Article 505 and to Article 501. In fact there are panel action rewrites to both Article 505, 501 and 502.
We attribute the problems with this draft to the following:
a) the use of several earlier drafts that were consistently being revised to keep pace with changes made due to committee actions on public proposals.
b) the limited time available to proof and develop this work,
c) the extremely large number of public proposals,
d) the complex nature of the interaction of affected texts within Articles 500, 501, 502 and 505, and the desire of the panel to maintain consistency, and
e) human errors in transcribing this information.
The following text provides a correct revision of this complete work effort for Article 505. This text should be the committee document of record and not that provided with the panel ballot.

ARTICLE 505 -- Class I, Zone 0, 1, and 2 Locations

505-1. Scope [unchanged]
This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 500 for electrical and electronic equipment and wiring

for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases, vapors, or liquids.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; and Class III, Division 1 or Division 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 500 through 504.

[new] 505-2 Definitions. For purposes of this article, the following definitions apply. [14-320,CP140x]

Identified (as applied to equipment). Recognizable as suitable for the specific purpose, function, use, environment, application, etc., where prescribed in a particular Code requirement.

FPN: Suitability of equipment for a specific purpose, environment, or application may be determined by:

~~1.~~4. equipment listing or labeling;

2. evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation; or

3. other evidence acceptable to the authority having jurisdiction such as a manufacturer's self evaluation or an owner's engineering judgment.

(See definitions of *Labeled* and *Listed*)

[CP140?-500 rewrite, Panel action Cook actions, correlation w/500]

Unclassified Locations. Locations that have been evaluated by the classification process defined in Section 500-~~3~~5(a) or Section 505-~~3~~5 (a) and determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof. [14-323, CP140x]

Nonhazardous Locations. Locations which are not required to have been evaluated by the process defined in 500-~~3~~5 (a) or 505-~~3~~5 (a). [CP140x]

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with an electrical installation, as well as any portable or transportable device having a battery or other electrical power source. (14-6)

Flameproof. Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

FPN: See Electrical Apparatus for Use In Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection — Flameproof "d," ISA S12.22.01-1996; Electrical Apparatus for Explosive Gas Atmospheres, Part 1 — Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus, IEC 79-1-1990 and Amendment No. 1 (1993).

Purged and Pressurized. Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

FPN No. 1: See Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

FPN No. 2: See Electrical Apparatus for Explosive Gas Atmospheres - Part 2: Electrical Apparatus, Type of Protection "p," IEC 79-2-1983; and Electrical Apparatus for Explosive Gas Atmospheres - Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization, IEC 79-13-1982.

Intrinsic Safety. Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

FPN No. 1: See Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations, ANSI/UL 913-1997; Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Intrinsic Safety "i," IEC 60079-11-1999.

FPN No. 2: Intrinsic safety is designated type of protection "ia" by IEC 79-11 for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" by IEC 79-11 for use in Zone 1 locations.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe equipment ("ia" or "ib" respectively), but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Type of Protection "n." Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

FPN: see Electrical Apparatus for Explosive Gas Atmospheres, Part 15 — Electrical Apparatus with Type of Protection "n," IEC 79-15-1987.

Oil Immersion "o." Type of protection where electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Oil-Immersion "o," ISA S12.26.01 — 1996; and Electrical Apparatus for Explosive Gas Atmospheres, Part 6 — Oil-Immersion "o," IEC 79-6-1995.

Increased Safety "e." Type of protection where electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Increased Safety "e," ISA S12.16.01-1996; and Electrical Apparatus for Explosive Gas Atmospheres — Part 7: Increased Safety "e," IEC 79-7-1990, Amendment No. 1 (1991), and Amendment No. 2 (1993).

Encapsulation "m." Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Encapsulation "m," ISA S12.23.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m," IEC 79-18-1992.

Powder Filling "q." Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

FPN: See Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Powder Filling "q," ISA S12.25.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling, Type of Protection "q," IEC 79-5-1967.

505-~~3~~2. ~~[505-2]~~ Other Articles

All other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.

Exception: As modified by Article 504 and this article.

505-~~3~~4 General

(a) ~~[505-10 (c)]~~ Documentation for Industrial Occupancies.

All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

FPN: For examples of area classification drawings, see Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 79-10-1995; Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, API RP 505-1997; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997; Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division I or Division 2, API RP 500-1997, Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

(b) ~~[505-5]~~ Reference Standards.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association, the American Petroleum Institute, and the International Society for Measurement and Control (ISA), that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 79-10-1995; Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, ANSI/API RP 505-1997~~6~~; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.

FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996, and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2, API RP 500-1997, Section 6.3.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassifed and Class I, Zone 0, Zone 1, and Zone 2 Locations~~Production Platforms~~, ANSI/API RP 14FZ-2000~~1991~~.

FPN No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see Electrical Apparatus for Explosive Gas Atmospheres — Part 14: Electrical Installations in Explosive Gas Atmospheres (Other than Mines), IEC 79-14-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 16: Artificial Ventilation for the Protection of Analyzer(s) Houses, IEC 79-16-1990.

505-~~4~~5 Classifications of Locations

(a) ~~[505-3(a)]~~ Classification of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified.

Each room, section, or area shall be considered individually in determining its classification.

FPN No. 1: See Section 505-~~6~~7 for restrictions on area classification.

FPN No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location ~~less hazardous or in nonhazardous locations~~ and, thus, to reduce the amount of special equipment required. [14-323]

Rooms and areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation, may be classified as "unclassified" locations.

FPN: For further information regarding classification and ventilation of areas involving ammonia, see Safety Code for Mechanical Refrigeration, ANSI/ASHRAE 15-1994, and Safety Requirements for the Storage and Handling of Anhydrous Ammonia, ANSI/CGA G2.1-1989 (14-39)

(b) Class I Zone Locations.
Class I Zone locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I Zone locations shall include those specified in (1), (2) and (3).

(1) ~~[505-9 (a)]~~ Class I, Zone 0. A Class I, Zone 0 location is a location
(a) ~~[505-9 (a) (1)]~~ In which ignitible concentrations of flammable gases or vapors are present continuously, or
(b) ~~[505-9 (a) (2)]~~ In which ignitible concentrations of flammable gases or vapors are present for long periods of time.

FPN No. 1: As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2, API RP 505-1996; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous Areas, IEC 79-10-1995; and Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum; and Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997.

FPN No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.

FPN No. 3: It is not good practice to install electrical equipment in Zone 0 locations except when the equipment is essential to the process or when other locations are not feasible. [See Section 505-3(a) FPN No. 2.] If it is necessary to install electrical systems in a Zone 0 location, it is good practice to install intrinsically safe systems as described by Article 504.

(2) ~~[505-9 (b)]~~ Class I, Zone 1. A Class I, Zone 1 location is a location
(a) ~~[505-9 (b) (1)]~~ In which ignitible concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
(b) ~~[505-9 (b) (2)]~~ In which ignitible concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
(c) ~~[505-9 (b) (3)]~~ In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitible concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or

(d) ~~[505-9 (b) (4)]~~ That is adjacent to a Class I, Zone 0 location from which ignitible concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: Normal operations is considered the situation when plant equipment is operating within its design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seats and flange gaskets, and spillage caused by accidents) are not considered normal operation.

FPN No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or easily ruptured containers; and other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operation, but not classified Zone 0.

(3) ~~[505-9 (c)]~~ **Class I, Zone 2**. A Class I, Zone 2 location is a location

(a) ~~[505-9 (c) (1)]~~ In which ignitible concentrations of flammable gases or vapors are not likely to occur in normal operation and if they do occur will exist only for a short period; or

(b) ~~[505-9 (c) (2)]~~ In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used, but in which the liquids, gases, or vapors normally are confined within closed containers of closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or

(c) ~~[505-9 (c) (3)]~~ In which ignitible concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation, but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or

(d) ~~[505-9 (c) (4)]~~ That is adjacent to a Class I, Zone 1 location, from which ignitible concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used, but which would become hazardous only in case of an accident or of some unusual operating condition.

505-~~5~~6 ~~[505-7]~~ Material Groups

~~[505-7]~~ For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in (a), (b), and (c).

FPN: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This Code does not apply to installations underground in mines. See Section 90-2(b).

Group II shall be subdivided into IIC, IIB, and IIA, as noted in (a), (b), and (c), according to the nature of the gas or vapor, for protection techniques “d,” “ia,” “ib,” “[ia],” and “[ib],” and, where applicable, “n” and “o.”

FPN No. 1: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in Construction and Verification Tests of Flameproof Enclosures of Electrical Apparatus, IEC 79-1A-1975, Amendment No. 1 (1993) and UL Technical Report No. 58 (1993). The test equipment for determining MIC is described in Spark-Test Apparatus for Intrinsically-Safe Circuits, IEC 79-3-1990. The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in Classification of Mixtures of Gases or Vapours with Air According to Their Maximum Experimental Safe Gaps and Minimum Igniting Currents, IEC 79-12-1978.

FPN No. 2: Verification of electrical equipment utilizing protection techniques “e,” “m,” “p,” and “q,” due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.

FPN No. 3: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

(a) Class I Zone Group Classifications. Class I Zone groups shall be as follows:

(1) ~~[505-7 (a)]~~ Group IIC. Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or minimum igniting current ratio (MIC ratio) less than or equal to 0.45.

FPN: Group IIC is equivalent to a combination of Class I, Group A, and Class I, Group B, as described in Sections 500-6 (a) (1)~~5(a)(1)~~ and 6 (a) (2)~~(a)(2~~).

(2) ~~[505-7 (b)]~~ Group IIB. Atmospheres containing acetaldehyde, ethylene, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either maximum experimental safe gap (MESG) values greater than 0.50 mm and less than or equal to 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.45 and less than or equal to 0.80.

FPN: Group IIB is equivalent to Class I, Group C, as described in Section 500-6.~~5~~(a)(3).

(3) ~~[505-7 (c)]~~ Group IIA. Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experiment safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN: Group IIA is equivalent to Class I, Group D as described in Section 500-6.~~5~~(a)(4).

505-~~6~~7 ~~[505-6]~~ Special Precaution

Article 505 requires equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.

FPN No. 2: Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by Section 505-8 (a) ~~4(a)~~ may not be suitable for use at temperatures lower than -20ºC (-13ºF) unless they are approved for use at lower temperatures. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.

~~**(a)** [505-6(a)] **Supervision of Work.** Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer.~~(14-348)

(~~a~~b) ~~[505-6(b)]~~ **Dual Classification.** In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations.

Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

(b~~c~~) ~~[505-6(c)]~~ Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.

(c) Solid Obstacles. Flameproof equipment with flanged joints shall not be installed such that the flange openings are closer than the distances shown in Table 505-7 ~~505-15~~ to any solid obstacle that is not a part of the equipment (such as steelworks, walls, weather guards, mounting brackets, pipes, or other electrical equipment) unless the equipment is listed for a smaller distance of separation. [14-364]

Table 505-7 ~~-15~~. Minimum Distance of Obstructions from Flameproof "d" Flange Openings

Gas Group	Minimum Distance In.	Minimum Distance Mm
IIC	1 37/64	40
IIB	1 3/16	30
IIA	25/64	10

505- ~~7-8~~ ~~[505-4]~~ Protection Techniques
The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

FPN: For additional information, see Electrical Apparatus for Use in Class I, Zone 0, 1 Hazardous (Classified) Locations General Requirements, ISA S12.0.01-1997; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279, 1997; and Electrical Apparatus for Explosive Gas Atmospheres - Part 0: General Requirements, IEC 79-0-1983, Amendment No. 1 (1987), and Amendment No. 2 (1991).

~~(a)~~(b) ~~[505-4(a)]~~ Flameproof "d." This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(b) ~~[505-4(b)]~~ Purged and Pressurized. This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is approved.

(c) ~~[505-4(c)]~~ Intrinsic Safety. This protection technique shall be permitted for equipment in Class I, Zone 0 or Zone 1 locations for which it is approved.

(d) ~~[505-4(d)]~~ Type of Protection "n." This protection technique shall be permitted for equipment in Class I, Zone 2 locations. Type of protection "n" is further subdivided into nA, nC, and nR.

FPN: See Table 505-9(b) (1) ~~505-10(b) 1~~ for the descriptions of subdivisions for type of protection "n."

(e) ~~[505-4(e)]~~ Oil Immersion "o." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(f) ~~[505-4(f)]~~ Increased Safety "e." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(g) ~~[505-4(g)]~~ Encapsulation "m." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

(h) ~~[505-4(h)]~~ Powder Filling "q." This protection technique shall be permitted for equipment in Class I, Zone 1 locations.

505-~~8~~9 Equipment

(a) ~~[505-10 (a)]~~ Listing.
(1) Equipment that is listed for a Zone 0 location shall be permitted in a Zone 1 or Zone 2 location of the same gas or vapor. Equipment that is identified ~~listed~~ for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor.

(2) ~~[505-7(d)]~~ Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

FPN: One common example is equipment marked for "IIB + H2."

(b) ~~[505-10(b)]~~ Marking
Equipment shall be marked in accordance with (1) or (2).
(1) ~~[505-10(b)(1)]~~ Division Equipment. Equipment identified ~~approved~~ for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with Section 500-~~5~~6(d), be permitted to be marked with the following:
a. Class I, Zone 1 or Class I, Zone 2 (as applicable), and
b. Applicable gas classification group(s) in accordance with Table 505-~~8~~9(b)(2), and
c. Temperature classification in accordance with Section 505-~~8~~9(3)

(2) ~~[505-10(b)(2)]~~ Zone Equipment. Equipment meeting one or more of the protection techniques described in Section 505-~~4~~5 shall be marked with the following in the order shown:
a. Class
b. Zone
c. Symbol "AEx"
d. Protection technique(s) in accordance with Table 505-~~8~~9(b)(2)
e. Applicable gas classification group(s) in accordance with Table 505-~~8~~9(b)(2)
f. Temperature classification in accordance with Section 505-~~8~~9(c)
Exception: Intrinsically safe associated apparatus shall be required to be marked only with (c), (d), and (e).

FPN No. 1: An example of such a required marking is "Class I, Zone 0, AEx ia IIC T6."
Electrical equipment of types of protection "e," "m," "p," or "q," shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "[ia]," or "[ib]" shall be marked Group IIA, or IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN No. 2: An explanation of the marking that is required follows.

Figure 505-~~8~~9(b)(1) ~~[505-10(b)(1)]~~.

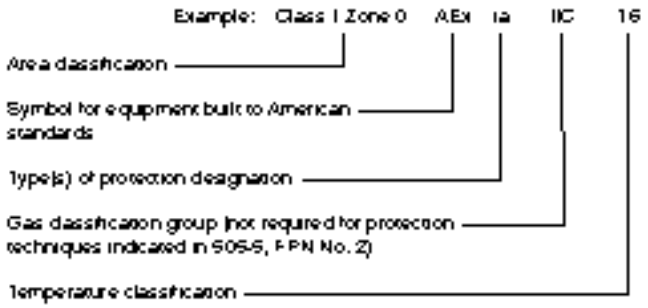

Table 505-~~8~~9(b)(1). Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated apparatus	Unclassified or Nonhazardous
[ib]	Intrinsically safe associated apparatus	Unclassified or Nonhazardous
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nR	Restricted breathing enclosure	2
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

* Does not address use where a combination of techniques is used.

Table 505-~~8~~9(b)(2). ~~[505-10(b)(2)]~~ Gas Classification Groups

Gas Group	Comment
IIC	See Section 505-~~5~~6(a)(1)
IIB	See Section 505-~~5~~6(a) (2)~~(b)~~
IIA	See Section 505-~~5~~6(a)(3)~~(c)~~

(c) ~~[505-8]~~ Class I Temperature

The temperature marking specified below ~~in Section 505-10(b)~~ shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994; and Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus, IEC 79-20-1996.

(1) ~~[505-10(b)(3)]~~ **Temperature Classifications.** Approved equipment shall be marked to show the operating temperature or temperature ~~range~~ class referenced to a 40ºC (104ºF) ambient. The temperature ~~range~~class, if provided, shall be indicated using the temperature class (T Code) ~~in identification numbers, as~~ shown in Table 505-~~8~~9(c).

Table 505-~~8~~9(c). ~~[505-10(b)(3)]~~ Classification of Maximum Surface Temperature for Group II Electrical Equipment

Temperature Class (T Code)	Maximum Surface Temperature (ºC)
T1	≤450
T2	≤300
T3	≤200
T4	≤135
T5	≤100
T6	≤85

Electrical equipment designed for use in the ambient temperature range between -20ºC and +40ºC shall require no additional temperature marking.
Electrical equipment that is designed for use in a range of ambient temperatures other than -20ºC and +40ºC is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol "Ta" or "Tamb" together with the special range of ambient temperatures. As an example, such a marking might be "-30ºC Ta + 40ºC."
Electrical equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature ~~range~~ class at that ambient temperature.

Exception No. 1: Equipment of the nonheat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature ~~range~~ class.

Exception No. 2: Equipment approved for Class I, Division 1 or Division 2 locations as permitted by Sections 505-20(b) and (c) shall be permitted to be marked in accordance with Section 500-~~5~~6(d) and Table 500-~~5~~6(d).

(d) ~~[505-3(b)]~~ **Threading**
All threaded conduit referred to herein shall be threaded with an National (American) Standard Pipe Taper (NPT) standard conduit cutting die that provides 3/4-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Threaded joints shall be made up with at least five threads fully engaged.

Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.

FPN: Threading specifications for NPT threads are located in Pipe Threads, General Purpose (Inch), ANSI/ASME B1.20.1-1983.

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1-1980, and Metric Screw Threads, ISO 965/3-1980.

505-15.~~[505-15]~~[14-364] Wiring Methods. Wiring methods shall maintain the integrity of protection techniques and shall comply with (a), (b), or (c).

(a) Class I, Zone 0. In Class I, Zone 0 locations, only intrinsically safe wiring methods in accordance with Article 504 shall be permitted.

FPN: Article 504 only includes protection technique "ia."

(b) Class I, Zone 1.

(1) In Class I, Zone 1 locations, the following wiring methods shall be permitted:

(a) Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.

FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

(b) Type ITC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable

polymeric material and provided with termination fittings listed for the application.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type TC cable shall be permitted if listed as suitable for use as open wiring and provided with a gas/vaportight overall jacket of suitable polymeric material and provided with separate grounding conductors in accordance with Section 250-122. Cable termination fittings shall be listed for the application. The open wiring shall not exceed lengths of 15 feet.

FPN: Type TC cable listed for use as open wiring meets the crush and impact requirements of Type MC cable.

(d) Type MI cable with termination fittings approved for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

(2) Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of Section 505-17 shall be permitted.

(c) Class I, Zone 2.

(1) In Class I, Zone 2 locations, the following wiring methods shall be permitted:

(a) Types MI, MC, MV, or TC cable with approved termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings;
(b) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;
(c) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings;
(d) enclosed gasketed busways, enclosed gasketed wireways;
(e) threaded rigid metal conduit, threaded steel intermediate metal conduit;
(f) Nonincendive field wiring using any of the wiring methods suitable for nonhazardous locations, including Chapter 7 and 8 wiring methods.

(2) Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with approved fittings, or flexible cord in accordance with the provisions of Section 505-17 shall be permitted.

FPN: See Section 505-25(b) for grounding requirements where flexible conduit is used.

[new- NFPA check formating]
505-16. Sealing and Drainage. Seals in conduit and cable systems shall comply with (a) through (e). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 505-16(c)(2)(b). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 505-16(d)(2).

FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Zone 0. In Class I, Zone 0 locations, seals shall be located as follows.
(1) Seals shall be provided within 10 ft (3.05 m) of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.

Exception: A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 12 in. (305 mm) beyond each boundary, shall not be required to be sealed, if the termination points of the unbroken conduit are in unclassified locations.

(2) Seals shall be provided on cables at the first point of termination after entry into the Zone 0 location.

(3) Seals shall not be required to be explosionproof or flameproof.

(b) Zone 1. In Class I, Zone 1 locations, seals shall be located as follows.

(1) Conduit seals shall be provided for each conduit entering enclosures having type of protection 'd' or 'e'.

Exception: Where the enclosure having type of protection 'd' is marked to indicate that a seal is not required.

(2) Conduit seals shall be provided for each conduit entering explosionproof equipment as follows.
a. In each conduit entry into an explosionproof enclosure where either (1) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (2) the entry is 2-in. size or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the

autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception: Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are

1. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
2. Immersed in oil, or
3. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, approved for the location, and marked "factory sealed" or equivalent.
Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.

b. Conduit seals shall be installed within 18 in. (457 mm) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

c. Where two or more explosionproof enclosures for which conduit seals are required under (b)(2) are connected by nipples or by runs of conduit not more than 36 in. (914 mm) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 18 in. (457 mm) from either enclosure.

(3) In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.
FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(4) In each conduit run leaving a Class I, Zone 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 1 location.

Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Zone 1 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(5) Conduits containing cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 18 in. (457 mm) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved means. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

(6) Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (d).

(7) Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with (d).

(8) Cables shall be sealed at the point at which they leave the Zone 1 location.

Exception: Where cable is sealed at the termination point.

(c) Zone 2 In Class I, Zone 2 locations, seals shall be located as follows.

(1) Conduit seals shall be located as follows.

(a) For connections to enclosures that are required to be flameproof or explosionproof, a conduit seal shall be provided in accordance with (b)(1) and (b)(2). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section 505-16(b).

(2) In each conduit run passing from a Class I, Zone 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Zone 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Zone 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Zone 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Zone 2 location into an unclassified location if the following conditions are met:

1. No part of the conduit system segment passes through a Class I, Zone 0 or Class I, Zone 1 location where the conduit

contains unions, couplings, boxes, or fittings within 12 in. (305 mm) of the Class I, Zone 0 or Class I, Zone 1 location; and

2. The conduit system segment is located entirely in outdoor locations; and

3. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and

4. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and

5. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Zone 2 locations.

(3) Cable seals shall be located as follows.

(a) Cables entering enclosures required to be flameproof or explosionproof shall be sealed at the point of entrance. The seal shall comply with (d). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (b)(4).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(b) Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (2)(a). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [0.007 ft3/hour (198 cm3/hour) of air at a pressure of 6 in. of water (1493 pascals)].

FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

(c) Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (2)(a), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water (1493 pascals) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Zone 2 location without seals.

(d) Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Zone 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

FPN: The cable sheath may be either metal or a nonmetallic material.

(d) Class I, Zones 0, 1 and 2. Where required, seals in Class I, Zones 0, 1 and 2 locations shall comply with the following.

(1) Fittings. Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings for Class I locations shall be used. Sealing fittings shall be accessible. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

(2) Compound. The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF).

(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 5/8 in. (16 mm).

Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.

(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

(5) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically listed for a higher percentage of fill.

(e) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

(3) Canned Pumps, Process or Service Connections, Etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend upon a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical conduit system, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the conduit system beyond the additional devices or means, if the primary seal fails.

The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above.

Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.

(14-368)

505-17. Flexible Cords, Class I, Zones 1 and 2. A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring methods of Section 505-15(b) cannot provide the necessary degree of movement for fixed and mobile electrical utilization equipment, in an industrial establishment where conditions of maintenance and engineering supervision ensure that only qualified persons will install and service the installation, and the flexible cord is protected by location or by a suitable guard from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall be as follows:

1. Of a type listed ~~approved~~ for extra-hard usage;
2. Contain, in addition to the conductors of the circuit, a grounding conductor complying with Section 400-23;
3. Connected to terminals or to supply conductors in an approved manner;
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension no the terminal connections; and
5. Be provided with suitable seals where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof.

Exception: As provided in 505-15(c).

Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be permitted.

Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization equipment.

FPN: See Section 505-18 for flexible cords exposed to liquids having a deleterious effect on the conductor insulation.

[14-173]

505-19. Conductors and Conductor Insulation.

1) For Type of Protection "e", field wiring conductors shall be copper. (14-365)

2) Where condensed vapors or liquids may collect on, or come in contact with, the insulation on conductors, such insulation shall be of a type approved for use under such conditions; or the insulation shall be protected by a sheath of lead or by other approved means. (14-181)

505-19. Live Parts. There shall be no exposed live parts.(14-188)

505-20. Equipment

(a) Zone 0. In Class I, Zone 0 locations, only equipment specifically listed and marked as suitable for the location shall be permitted.

Exception: Intrinsically safe equipment listed for use in Class I, Division 1 locations for the same gas, or as permitted by Section 505-7(d), and with a suitable temperature classification ~~rating~~ shall be permitted. [correlation Art500 temperature]

(b) Zone 1. In Class I, Zone 1 locations, only equipment specifically identified ~~listed~~ and marked as suitable for the location shall be permitted. [correlation with Cook identifed & Art 500, CP140?, CP140x,]

Exception: Equipment approved for use in Class I, Division 1 or listed for use in Class I, Zone 0 locations for the same gas, or as permitted by Section 505-7(d) and with a suitable temperature classification ~~rating~~ shall be permitted.

(c) Zone 2 In Class I, Zone 2 locations, only equipment specifically identified ~~listed~~ and marked as suitable for the location shall be permitted. [see above]

Exception No. 1: Equipment identified ~~listed~~ for use in Class I, Zone 0 or Zone 1 locations for the same gas, or as permitted by Section 505-9(a)(2)~~505-7(d)~~, and with a suitable temperature classification~~rating~~, shall be permitted.

Exception No. 2: Equipment identified ~~approved~~ for use in Class I, Division 1 or Division 2 locations for the same gas, or as permitted by Section 505-9(a)(2) ~~505-7(d),~~ and with a suitable temperature classification ~~rating~~ shall be permitted.

Exception No. 3: In Class I, Zone 2 locations, the installation of open or nonexplosionproof or nonflameproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Zone 2 location shall be permitted.

FPN No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

FPN No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitible gases or vapors is suspected, clean air purging may be needed immediately prior to and during start-up periods.

(d) Manufacturer's Instructions. Electrical equipment installed in hazardous (classified) locations shall be installed in accordance with the instructions (if any) provided by the manufacturer.

505-21. Multiwire Branch Circuits. In a Class I, Zone 1 location, a multiwire branch circuit shall not be permitted.

Exception: Where the disconnect device(s) for the circuit opens all ungrounded conductors of the multiwire circuit simultaneously. [14-198]

505-22. ~~[505-21]~~ Increased Safety "e" Motors and Generators. In Class I, Zone 1 locations, Increased Safety "e" motors and generators of all voltage ratings shall be listed for Class I, Zone 1 locations, and shall comply with the following.

1. Motors shall be marked with the current ratio, IA/IN, and time, tE;
2. Motors shall have controllers marked with the model or identification number, output rating (horsepower or kilowatt), full-load amperes, starting current ratio (IA/IN), and time (tE) of the motors that they are intended to protect; the controller marking shall also include the specific overload protection type (and setting, if applicable) that is listed with the motor or generator;
3. Connections shall be made with the specific terminals listed with the motor or generator;
4. Terminal housings shall be permitted to be of substantial, nonmetallic, nonburning material provided an internal grounding means between the motor frame and the equipment grounding connection is incorporated within the housing;
5. The provisions of Part C of Article 430 shall apply regardless of the voltage rating of the motor;
6. The motors shall be protected against overload by a separate overload device that is responsive to motor current. This device shall be selected to trip or shall be rated in accordance with the listing of the motor and its overload protection;
7. Sections 430-34 and 430-44 shall not apply to such motors; and
8. The motor overload protection shall not be shunted or cut out during the starting period.

505-25. Grounding and Bonding. Grounding and bonding shall comply with Article 250 and the following additional requirements.

(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.

Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting

means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.

FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.

(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 505-15(c) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.

Exception: In Class I, Zone 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.

a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.

b. Overcurrent protection in the circuit is limited to 10 amperes or less.

c. The load is not a power utilization load.

(Log #2136)

14- 320 - (505): Accept in Principle

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Reorganize Article 505 as indicated below per NEC CMA Proposal 14-1b. With the exception of minor titling changes and a rearrangement of sentences as indicated within one section, this proposal contains no new words, concepts or requirements.

Revise Article 505 as follows:

1) Rename 505-3 as "General"; relocate entire section 505-10 (c) as new item (a) titled "Documentation of Industrial Occupancies." Also relocate section 505-5 Reference Standards to new item (b).

With change:

505-3 General.

(a) Documentation for Industrial Occupancies.

~~505-10 (c) Documentation for Industrial Occupancies.~~ All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

FPN: For examples of area classification drawings, see Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 79-10-1995; Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, API RP 505-1997; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997; Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division I or Division 2, API RP 500-1997, Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

(b) Reference Standards.

~~505-5. Reference Standards~~

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association, the American Petroleum Institute, and the International Society for Measurement and Control (ISA), that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

FPN No. 2: For further information on the classification of locations, see Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 79-10-1995; Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, API RP 505-1996; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.

FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996, and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2, API RP 500-1997, Section 6.3.

FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Design and Installation of Electrical Systems for Offshore Production Platforms, ANSI/API RP 14F-1991.

FPN No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see Electrical Apparatus for Explosive Gas Atmospheres — Part 14: Electrical Installations in Explosive Gas Atmospheres (Other than Mines), IEC 79-14-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 16: Artificial Ventilation for the Protection of Analyzer(s) Houses, IEC 79-16-1990.

2) Rename and number existing 505-3 as 505-4 and provide a new title "Classification of Locations. Relocate sections 505-9 (a) (b) (c) under this section and renumber accordingly.

With change:

505-4 Classifications of Locations.

~~505-3. Location and General Requirements.~~

(a) Classification of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified.

Each room, section, or area shall be considered individually in determining its classification.

FPN No. 1: See Section 505-6 for restrictions on area classification.

FPN No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in less hazardous or in nonhazardous locations and, thus, to reduce the amount of special equipment required.

(b) Class I Zone Locations. Class I Zone locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I Zone locations shall include those specified in (1), (2) and (3).

~~505-9. Zone Classification~~

~~The classification into zones shall be in accordance with the following.~~

(1) Class I, Zone 0. A Class I, Zone 0 location is a location

(a) In which ignitible concentrations of flammable gases or vapors are present continuously, or

(b) In which ignitible concentrations of flammable gases or vapors are present for long periods of time.

FPN No. 1: As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2, API RP 505-1996; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous Areas, IEC 79-10-1995; and Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum; and Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997.

FPN No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside

open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.

FPN No. 3: It is not good practice to install electrical equipment in Zone 0 locations except when the equipment is essential to the process or when other locations are not feasible. [See Section 505-3(a) FPN No. 2.] If it is necessary to install electrical systems in a Zone 0 location, it is good practice to install intrinsically safe systems as described by Article 504.

(2) Class I, Zone 1. A Class I, Zone 1 location is a location
(a) In which ignitible concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
(b) In which ignitible concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
(c) In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitible concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
(d) That is adjacent to a Class I, Zone 0 location from which ignitible concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: Normal operations is considered the situation when plant equipment is operating within its design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seats and flange gaskets, and spillage caused by accidents) are not considered normal operation.

FPN No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or easily ruptured containers; and other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operation, but not classified Zone 0.

(3) Class I, Zone 2. A Class I, Zone 2 location is a location
(a) In which ignitible concentrations of flammable gases or vapors are not likely to occur in normal operation and if they do occur will exist only for a short period; or
(b) In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used, but in which the liquids, gases, or vapors normally are confined within closed containers of closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or
(c) In which ignitible concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation, but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or
(d) That is adjacent to a Class I, Zone 1 location, from which ignitible concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used, but which would become hazardous only in case of an accident or of some unusual operating condition.

3) Make section 505-5 “Material Groups” and relocate section 507 (a) (b) and (c) under this section, renumbering as shown.

With change:

505-5 Material Groups.
~~505-7. Grouping and Classification.~~
For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in (a), (b), and (c).

FPN: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This Code does not apply to installations underground in mines. See Section 90-2(b).

Group II shall be subdivided into IIC, IIB, and IIA, as noted in (a), (b), and (c), according to the nature of the gas or vapor, for protection techniques “d,” “ia,” “ib,” “[ia],” and “[ib],” and, where applicable, “n” and “o.”

FPN No. 1: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in Construction and Verification Tests of Flameproof Enclosures of Electrical Apparatus, IEC 79-1A-1975, Amendment No. 1 (1993) and UL Technical Report No. 58 (1993). The test equipment for determining MIC is described in Spark-Test Apparatus for Intrinsically-Safe Circuits, IEC 79-3-1990. The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in Classification of Mixtures of Gases or Vapours with Air According to Their Maximum Experimental Safe Gaps and Minimum Igniting Currents, IEC 79-12-1978.

FPN No. 2: Verification of electrical equipment utilizing protection techniques “e,” “m,” “p,” and “q,” due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.

FPN No. 3: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

(a) Class I Zone Group Classifications. Class I Zone groups shall be as follows:

(1) Group IIC. Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or minimum igniting current ratio (MIC ratio) less than or equal to 0.45.

FPN: Group IIC is equivalent to a combination of Class I, Group A, and Class I, Group B, as described in Sections 500-5(a)(1) and (a)(2).

(2) Group IIB. Atmospheres containing acetaldehyde, ethylene, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either maximum experimental safe gap (MESG) values greater than 0.50 mm and less than or equal to 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.45 and less than or equal to 0.80.

FPN: Group IIB is equivalent to Class I, Group C, as described in Section 500-5(a)(3).

(3) Group IIA. Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experiment safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN: Group IIA is equivalent to Class I, Group D as described in Section 500-5(a)(4).

4) Retain 505-6 as is.

5) Make 505-7 "Protection Techniques" and relocate all of 505-4 (a) - (h) under this section.

With change:

505- 7 Protection Techniques.
~~505-4. Protection Techniques.~~
The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

FPN: For additional information, see Electrical Apparatus for Use in Class I, Zone 0, 1 Hazardous (Classified) Locations General Requirements, ISA S12.0.01-1997; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279, 1997; and Electrical Apparatus for Explosive Gas Atmospheres - Part 0: General Requirements, IEC 79-0-1983, Amendment No. 1 (1987), and Amendment No. 2 (1991).

(a) Flameproof "d." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Flameproof is a type of protection of electrical equipment in which the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive atmosphere consisting of one or more of the gases or vapors for which it is designed.
FPN No. 2: For further information, see Electrical Apparatus for Use In Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection — Flameproof "d," ISA S12.22.01-1996; Electrical Apparatus for Explosive Gas Atmospheres, Part 1 — Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus, IEC 79-1-1990 and Amendment No. 1 (1993).

(b) Purged and Pressurized. This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is approved.

FPN No. 1: In some cases, hazards may be reduced or hazardous (classified) locations limited or eliminated by adequate positive-pressure ventilation from a source of clean air in conjunction with effective safeguards against ventilation failure.
FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.
FPN No. 3: Pressurized "p" is a type of protection of electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere. For further information, see Electrical Apparatus for Explosive Gas Atmospheres - Part 2: Electrical Apparatus, Type of Protection "p," IEC 79-2-1983; and Electrical Apparatus for Explosive Gas Atmospheres - Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization, IEC 79-13-1982.

(c) Intrinsic Safety. This protection technique shall be permitted for equipment in those Class I, Zone 0 or Zone 1 locations for which it is approved.

FPN No. 1: Intrinsic safety is designated type of protection "ia" by IEC 79-11 for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" by IEC 79-11 for use in Zone 1 locations.
FPN No. 2: For further information, see Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations, ANSI/UL 913-1997; Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Intrinsic Safety "i," IEC 79-11-1991; and Electrical Apparatus for Explosive Gas Atmospheres — Part 3: Spark-test Apparatus for Intrinsically-safe Circuits, IEC 79-3-1990.
FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe equipment ("ia" or "ib" respectively), but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

(d) Type of Protection "n." This protection technique shall be permitted for equipment in those Class I, Zone 2 locations for which it is approved. Type of protection "n" is further subdivided into nA, nC, and nR.

FPN No. 1: See Table 505-10(b) 1 for the descriptions of subdivisions for type of protection "n."
FPN No. 2: Type "n" protection is a type of protection applied to electrical equipment such that, in normal operation, the electrical equipment is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.
FPN No. 3: For further information, see Electrical Apparatus for Explosive Gas Atmospheres, Part 15 — Electrical Apparatus with Type of Protection "n," IEC 79-15-1987.

(e) Oil Immersion "o." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Oil immersion is a type of protection in which the electrical equipment or parts of the electrical equipment are immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.
FPN No. 2: For further information, see Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Oil-Immersion "o," ISA S12.26.01 — 1996; and Electrical Apparatus for Explosive Gas Atmospheres, Part 6 — Oil-Immersion "o," IEC 79-6-1995.

(f) Increased Safety "e." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Increased safety is a type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.
FPN No. 2: For further information, see Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Increased Safety "e," ISA S12.16.01-1996; and Electrical Apparatus for Explosive Gas Atmospheres — Part 7: Increased Safety "e," IEC 79-7-1990, Amendment No. 1 (1991), and Amendment No. 2 (1993).

(g) Encapsulation "m." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Encapsulation is a type of protection in which the parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.
FPN No. 2: For further information, see Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Encapsulation "m," ISA S12.23.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m," IEC 79-18-1992.

(h) Powder Filling "q." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Powder filling is a type of protection in which the parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.
FPN No. 2: For further information, see Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Powder Filling "q," ISA S12.25.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling, Type of Protection "q," IEC 79-5-1967.

6) Title section 505-8 Equipment, relocate 505-10 (a) as item (a) (1), relocate 505-7 (d) as (a) (2); create new section (b) titled "Marking" and move under this section 505-10 (b) (1) & (2); create new section (c) titled "Class I Temperature" and move 505-8 and 505-10 (b) (3) under this new section; create new section (d) titled "Threading" and relocate 505-3 (b) under this section. Renumber figures and tables accordingly.

With change:

505-8 Equipment.

(a) Listing.
(1) Equipment that is listed for a Zone 0 location shall be permitted in a Zone 1 or Zone 2 location of the same gas or vapor. Equipment that is listed for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor.

(2) ~~(d) Other.~~ Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

FPN: One common example is equipment marked for "IIB + H2."

(b) Marking.

~~(b) Marking.~~ Equipment shall be marked in accordance with (1) or (2).
(1) Division Equipment. Equipment approved for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with Section 500-7(b), be permitted to be marked with the following:
a. Class I, Zone 1 or Class I, Zone 2 (as applicable), and
b. Applicable gas classification group(s) in accordance with Table 505-8(b)(2), and
c. Temperature classification in accordance with Section 505-8(c)

(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in Section 505-4 shall be marked with the following in the order shown:
a. Class
b. Zone
c. Symbol "AEx"
d. Protection technique(s) in accordance with Table 505-10(b)(2)
e. Applicable gas classification group(s) in accordance with Table 505-10(b)(2)
f. Temperature classification in accordance with Section 505-10(b)(3)
Exception: Intrinsically safe associated apparatus shall be required to be marked only with (c), (d), and (e).

FPN No. 1: An example of such a required marking is "Class I, Zone 0, AEx ia IIC T6."

Electrical equipment of types of protection "e," "m," "p," or "q," shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "[ia]," or "[ib]" shall be marked Group IIA, or IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN No. 2: An explanation of the marking that is required follows.

Figure 505-8(b)(1).

Table 505-8(b)(1). Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated apparatus	Nonhazardous
[ib]	Intrinsically safe associated apparatus	Nonhazardous
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure	2
nR	Restricted breathing enclosure	2
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

* Does not address use where a combination of techniques is used.

Table 505-8(b)(2). Gas Classification Groups

Gas Group	Comment
IIC	See Section 505-5(a)
IIB	See Section 505-5(b)
IIA	See Section 505-5(c)

(c) Class I Temperature.

~~505-8. Class I Temperature.~~
The temperature marking specified ~~in Section 505-10(b)~~ shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994; and Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus, IEC 79-20-1996.

(1) ~~(3)~~ Temperature Classifications. Approved equipment shall be marked to show the operating temperature or temperature range referenced to a 40ºC (104ºF) ambient. The temperature range, if provided, shall be indicated in identification numbers, as shown in Table 505-8(c).

Table 505-8(c). Classification of Maximum Surface Temperature for Group II Electrical Equipment

Temperature Class	Maximum Surface Temperature (ºC)
T1	Û450
T2	Û300
T3	Û200
T4	Û135
T5	Û100
T6	Û85

Electrical equipment designed for use in the ambient temperature range between -20ºC and +40ºC shall require no additional temperature marking.
Electrical equipment that is designed for use in a range of ambient temperatures other than -20ºC and +40ºC is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol "Ta" or "Tamb" together with the special range of ambient temperatures. As an example, such a marking might be "-30ºC Ta + 40ºC."
Electrical equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature range at that ambient temperature.
Exception No. 1: Equipment of the nonheat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature range.
Exception No. 2: Equipment approved for Class I, Division 1 or Division 2 locations as permitted by Sections 505-20(b) and (c) shall be permitted to be marked in accordance with Section 500-5(d) and Table 500-5(d).

(d) Threading.
~~(b) Threading.~~ All threaded conduit referred to herein shall be threaded with an NPT standard conduit cutting die that provides _-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable.
Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).
(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.
(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1:1980, and Metric Screw Threads, ISO 965/3:1980.

7) Eliminate Section heading 505-10. No changes are made to other sections that follow 505-10.

Article 505 with recommended changes would appear as follows:

ARTICLE 505 -- Class I, Zone 0, 1, and 2 Locations
505-1. Scope. This article covers the requirements for the zone classification system as an alternative to the division classification system covered in Article 500 for electrical and electronic equipment and wiring for all voltages in Class I, Zone 0, Zone 1, and Zone 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases, vapors, or liquids.

FPN: For the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Division 1 or Division 2; Class II, Division 1 or Division 2; and Class III, Division 1 or Division 2 hazardous (classified) locations where fire or explosion hazards may exist due to flammable gases or vapors, flammable liquids, or combustible dusts or fibers, refer to Articles 500 through 504.

505-2. Other Articles
All other applicable rules contained in this Code shall apply to electrical equipment and wiring installed in hazardous (classified) locations.
Exception: As modified by Article 504 and this article.

505-3 General.
(a) Documentation for Industrial Occupancies. All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

FPN: For examples of area classification drawings, see Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 79-10-1995; Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, API RP 505-1997; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997; Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division I or Division 2, API RP 500-1997, Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.

(b) Reference Standards.

FPN No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association, the American Petroleum Institute, and the International Society for Measurement and Control (ISA), that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.
FPN No. 2: For further information on the classification of locations, see Electrical Apparatus for Explosive Gas Atmospheres, Classification of Hazardous Areas, IEC 79-10-1995; Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2, API RP 505-1996; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997; and Model Code of Safe Practice in the Petroleum Industry, Part 15: Area Classification Code for Petroleum Installations, IP 15, The Institute of Petroleum, London.
FPN No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see Recommended Practice on Static Electricity, NFPA 77-1993; Standard for the Installation of Lightning Protection Systems, NFPA 780-1997; and Protection Against Ignitions Arising Out of Static Lightning and Stray Currents, API RP 2003-1991.
FPN No. 4: For further information on ventilation, see Flammable and Combustible Liquids Code, NFPA 30-1996, and Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 or Division 2, API RP 500-1997, Section 6.3.
FPN No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see Design and Installation of Electrical Systems for Offshore Production Platforms, ANSI/API RP 14F-1991.
FPN No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see Electrical Apparatus for Explosive Gas Atmospheres — Part 14: Electrical Installations in Explosive Gas Atmospheres (Other than Mines), IEC 79-14-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 16: Artificial Ventilation for the Protection of Analyzer(s) Houses, IEC 79-16-1990.

505-4 Classifications of Locations.
(a) Classification of Locations. Locations shall be classified depending on the properties of the flammable vapors, liquids, or gases that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Where pyrophoric materials are the only materials used or handled, these locations shall not be classified.
Each room, section, or area shall be considered individually in determining its classification.

FPN No. 1: See Section 505-6 for restrictions on area classification.
FPN No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in less hazardous or in nonhazardous locations and, thus, to reduce the amount of special equipment required.

(b) Class I Zone Locations. Class I Zone locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I Zone locations shall include those specified in (1), (2) and (3).

(1) Class I, Zone 0. A Class I, Zone 0 location is a location
(a) In which ignitible concentrations of flammable gases or vapors are present continuously, or
(b) In which ignitible concentrations of flammable gases or vapors are present for long periods of time.

FPN No. 1: As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2, API RP 505-1996; Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous Areas, IEC 79-10-1995; and Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum; and Electrical Apparatus for Explosive Gas Atmospheres, Classifications of Hazardous (Classified) Locations, ISA S12.24.01-1997.

FPN No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.

FPN No. 3: It is not good practice to install electrical equipment in Zone 0 locations except when the equipment is essential to the process or when other locations are not feasible. [See Section 505-3(a) FPN No. 2.] If it is necessary to install electrical systems in a Zone 0 location, it is good practice to install intrinsically safe systems as described by Article 504.

(2) Class I, Zone 1. A Class I, Zone 1 location is a location
(a) In which ignitible concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
(b) In which ignitible concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
(c) In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitible concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
(d) That is adjacent to a Class I, Zone 0 location from which ignitible concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

FPN No. 1: Normal operations is considered the situation when plant equipment is operating within its design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seats and flange gaskets, and spillage caused by accidents) are not considered normal operation.

FPN No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or easily ruptured containers; and other locations where ignitible concentrations of flammable vapors or gases are likely to occur in the course of normal operation, but not classified Zone 0.

(3) Class I, Zone 2. A Class I, Zone 2 location is a location
(a) In which ignitible concentrations of flammable gases or vapors are not likely to occur in normal operation and if they do occur will exist only for a short period; or
(b) In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used, but in which the liquids, gases, or vapors normally are confined within closed containers of closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or
(c) In which ignitible concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation, but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or
(d) That is adjacent to a Class I, Zone 1 location, from which ignitible concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

FPN: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used, but which would become hazardous only in case of an accident or of some unusual operating condition.

505-5 Material Groups. For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in (a), (b), and (c).

FPN: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This Code does not apply to installations underground in mines. See Section 90-2(b).

Group II shall be subdivided into IIC, IIB, and IIA, as noted in (a), (b), and (c), according to the nature of the gas or vapor, for protection techniques “d,” “ia,” “ib,” “[ia],” and “[ib],” and, where applicable, “n” and “o.”

FPN No. 1: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in Construction and Verification Tests of Flameproof Enclosures of Electrical Apparatus, IEC 79-1A-1975, Amendment No. 1 (1993) and UL Technical Report No. 58 (1993). The test equipment for determining MIC is described in Spark-Test Apparatus for Intrinsically-Safe Circuits, IEC 79-3-1990. The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in Classification of Mixtures of Gases or Vapours with Air According to Their Maximum Experimental Safe Gaps and Minimum Igniting Currents, IEC 79-12-1978.

FPN No. 2: Verification of electrical equipment utilizing protection techniques “e,” “m,” “p,” and “q,” due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.

FPN No. 3: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

(a) Class I Zone Group Classifications. Class I Zone groups shall be as follows:

(1) Group IIC. Atmospheres containing acetylene, hydrogen, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value less than or equal to 0.50 mm or minimum igniting current ratio (MIC ratio) less than or equal to 0.45.

FPN: Group IIC is equivalent to a combination of Class I, Group A, and Class I, Group B, as described in Sections 500-5(a)(1) and (a)(2).

(2) Group IIB. Atmospheres containing acetaldehyde, ethylene, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either maximum experimental safe gap (MESG) values

greater than 0.50 mm and less than or equal to 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.45 and less than or equal to 0.80.

FPN: Group IIB is equivalent to Class I, Group C, as described in Section 500-5(a)(3).

(3) Group IIA. Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experiment safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.80.

FPN: Group IIA is equivalent to Class I, Group D as described in Section 500-5(a)(4).

505-6 Special Precaution. Article 505 requires equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.

FPN No. 2: Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by Section 505-4(a) may not be suitable for use at temperatures lower than -20ºC (-13ºF) unless they are approved for use at lower temperatures. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.

(a) Supervision of Work. Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer.

(b) Dual Classification. In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

(c) Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.

505- 7 Protection Techniques. The following shall be acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations.

FPN: For additional information, see Electrical Apparatus for Use in Class I, Zone 0, 1 Hazardous (Classified) Locations General Requirements, ISA S12.0.01-1997; Electrical Equipment for Use in Class I, Zone 0, 1, and 2 Hazardous (Classified) Locations, ANSI/UL 2279, 1997; and Electrical Apparatus for Explosive Gas Atmospheres - Part 0: General Requirements, IEC 79-0-1983, Amendment No. 1 (1987), and Amendment No. 2 (1991).

(a) Flameproof "d." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Flameproof is a type of protection of electrical equipment in which the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive atmosphere consisting of one or more of the gases or vapors for which it is designed.

FPN No. 2: For further information, see Electrical Apparatus for Use In Class I, Zone 1 and 2 Hazardous (Classified) Locations, Type of Protection — Flameproof "d," ISA S12.22.01-1996; Electrical Apparatus for Explosive Gas Atmospheres, Part 1 — Construction and Verification Test of Flameproof Enclosures of Electrical Apparatus, IEC 79-1-1990 and Amendment No. 1 (1993).

(b) Purged and Pressurized. This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is approved.

FPN No. 1: In some cases, hazards may be reduced or hazardous (classified) locations limited or eliminated by adequate positive-pressure ventilation from a source of clean air in conjunction with effective safeguards against ventilation failure.

FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

FPN No. 3: Pressurized "p" is a type of protection of electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere. For further information, see Electrical Apparatus for Explosive Gas Atmospheres - Part 2: Electrical Apparatus, Type of Protection "p," IEC 79-2-1983; and Electrical Apparatus for Explosive Gas Atmospheres - Part 13: Construction and Use of Rooms or Buildings Protected by Pressurization, IEC 79-13-1982.

(c) Intrinsic Safety. This protection technique shall be permitted for equipment in those Class I, Zone 0 or Zone 1 locations for which it is approved.

FPN No. 1: Intrinsic safety is designated type of protection "ia" by IEC 79-11 for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" by IEC 79-11 for use in Zone 1 locations.

FPN No. 2: For further information, see Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations, ANSI/UL 913-1997; Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Intrinsic Safety "i," IEC 79-11-1991; and Electrical Apparatus for Explosive Gas Atmospheres — Part 3: Spark-test Apparatus for Intrinsically-safe Circuits, IEC 79-3-1990.

FPN No. 3: Intrinsically safe associated apparatus, designated by [ia] or [ib], is connected to intrinsically safe equipment ("ia" or "ib" respectively), but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

(d) Type of Protection "n." This protection technique shall be permitted for equipment in those Class I, Zone 2 locations for which it is approved. Type of protection "n" is further subdivided into nA, nC, and nR.

FPN No. 1: See Table 505-10(b) 1 for the descriptions of subdivisions for type of protection "n."

FPN No. 2: Type "n" protection is a type of protection applied to electrical equipment such that, in normal operation, the electrical equipment is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

FPN No. 3: For further information, see Electrical Apparatus for Explosive Gas Atmospheres, Part 15 — Electrical Apparatus with Type of Protection "n," IEC 79-15-1987.

(e) Oil Immersion "o." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Oil immersion is a type of protection in which the electrical equipment or parts of the electrical equipment are immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

FPN No. 2: For further information, see Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Oil-Immersion "o," ISA S12.26.01 — 1996; and Electrical Apparatus for Explosive Gas Atmospheres, Part 6 — Oil-Immersion "o," IEC 79-6-1995.

(f) Increased Safety "e." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Increased safety is a type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the

possibility of excessive temperatures and of the occurrence of arcs and sparks.
FPN No. 2: For further information, see Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Increased Safety "e," ISA S12.16.01-1996; and Electrical Apparatus for Explosive Gas Atmospheres — Part 7: Increased Safety "e," IEC 79-7-1990, Amendment No. 1 (1991), and Amendment No. 2 (1993).

(g) Encapsulation "m." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Encapsulation is a type of protection in which the parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.
FPN No. 2: For further information, see Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Encapsulation "m," ISA S12.23.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m," IEC 79-18-1992.

(h) Powder Filling "q." This protection technique shall be permitted for equipment in those Class I, Zone 1 locations for which it is approved.

FPN No. 1: Powder filling is a type of protection in which the parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.
FPN No. 2: For further information, see Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection — Powder Filling "q," ISA S12.25.01-1996, and Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling, Type of Protection "q," IEC 79-5-1967.

505-8 Equipment.

(a) Listing.
(1) Equipment that is listed for a Zone 0 location shall be permitted in a Zone 1 or Zone 2 location of the same gas or vapor. Equipment that is listed for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor.

(2) Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

FPN: One common example is equipment marked for "IIB + H2."

(b) Marking. Equipment shall be marked in accordance with (1) or (2).
(1) Division Equipment. Equipment approved for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with Section 500-5(d), be permitted to be marked with the following:
a. Class I, Zone 1 or Class I, Zone 2 (as applicable), and
b. Applicable gas classification group(s) in accordance with Table 505-8(b)(2), and
c. Temperature classification in accordance with Section 505-8(3)

(2) Zone Equipment. Equipment meeting one or more of the protection techniques described in Section 505-4 shall be marked with the following in the order shown:
a. Class
b. Zone
c. Symbol "AEx"
d. Protection technique(s) in accordance with Table 505-8(b)(2)
e. Applicable gas classification group(s) in accordance with Table 505-8(b)(2)
f. Temperature classification in accordance with Section 505-8(c)
Exception: Intrinsically safe associated apparatus shall be required to be marked only with (c), (d), and (e).

FPN No. 1: An example of such a required marking is "Class I, Zone 0, AEx ia IIC T6."
Electrical equipment of types of protection "e," "m," "p," or "q," shall be marked Group II. Electrical equipment of types of protection "d," "ia," "ib," "[ia]," or "[ib]" shall be marked Group IIA, or IIB, or IIC, or for a specific gas or vapor. Electrical equipment of types of protection "n" shall be marked Group II unless it contains enclosed-break devices, nonincendive components, or energy-limited equipment or circuits, in which case it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor. Electrical equipment of other types of protection shall be marked Group II unless the type of protection utilized by the equipment requires that it shall be marked Group IIA, IIB, or IIC, or a specific gas or vapor.

FPN No. 2: An explanation of the marking that is required follows.

Figure 505-8(b)(1).

Table 505-8(b)(1). Types of Protection Designation

Designation	Technique	Zone*
d	Flameproof enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated apparatus	Nonhazardous
[ib]	Intrinsically safe associated apparatus	Nonhazardous
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted breathing enclosure enclosure	2
nR	Restricted breathing	2
o	Oil immersion	1
p	Purged and pressurized	1 or 2
q	Powder filled	1

* Does not address use where a combination of techniques is used.

Table 505-8(b)(2). Gas Classification Groups

Gas Group	Comment
IIC	See Section 505-5(a)
IIB	See Section 505-5(b)
IIA	See Section 505-5(c)

(c) Class I Temperature. The temperature marking shall not exceed the ignition temperature of the specific gas or vapor to be encountered.

FPN: For information regarding ignition temperatures of gases and vapors, see Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas, NFPA 497-1997; Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994; and Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus, IEC 79-20-1996.

(1) Temperature Classifications. Approved equipment shall be marked to show the operating temperature or temperature range referenced to a 40ºC (104ºF) ambient. The temperature range, if provided, shall be indicated in identification numbers, as shown in Table 505-8 (c).

Table 505-8(c). Classification of Maximum Surface Temperature for Group II Electrical Equipment

Temperature Class	Maximum Surface Temperature (ºC)
T1	Û450
T2	Û300
T3	Û200
T4	Û135
T5	Û100
T6	Û85

Electrical equipment designed for use in the ambient temperature range between -20ºC and +40ºC shall require no additional temperature marking.
Electrical equipment that is designed for use in a range of ambient temperatures other than -20ºC and +40ºC is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol "Ta" or "Tamb" together with the special range of ambient temperatures. As an example, such a marking might be "-30ºC Ta + 40ºC."
Electrical equipment suitable for ambient temperatures exceeding 40ºC (104ºF) shall be marked with both the maximum ambient temperature and the operating temperature or temperature range at that ambient temperature.
Exception No. 1: Equipment of the nonheat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100ºC (212ºF) shall not be required to have a marked operating temperature or temperature range
Exception No. 2: Equipment approved for Class I, Division 1 or Division 2 locations as permitted by Sections 505-20(b) and (c) shall be permitted to be marked in accordance with Section 500-5(d) and Table 500-5(d).

(d) Threading. All threaded conduit referred to herein shall be threaded with an NPT standard conduit cutting die that provides 3/4-in. taper per foot. Such conduit shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable.
Equipment provided with threaded entries for field wiring connections shall be installed in accordance with (1) or (2).
(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used.
(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings. For equipment with metric threaded entries, such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment. Adapters shall be used for connection to conduit or NPT-threaded fittings. Listed cable fittings that have metric threads shall be permitted to be used.

FPN: Threading specifications for metric threaded entries are located in Metric Screw Threads, ISO 965/1:1980, and Metric Screw Threads, ISO 965/3:1980.

SUBSTANTIATION: Currently, the introduction to Hazardous (Classified) Locations is presented with little regard to clarity and understanding. The text jumps from "classifications" to "documentation" to "threaded...", to "protection techniques", without ever providing groundwork as to the need for the protection techniques. Under the proposed revision, the reader is moved in a logical sequence, that defines general needs, addresses the classifications of locations, discusses material groups, before ever mentioning equipment. Then with protection techniques, equipment, equipment approvals, equipment markings and equipment designs are addressed. This provides a flow into the more specific sections beyond Article 505.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-318a addresses the submitter's proposed rewrite with one developed by Panel 14.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: Although I agree with a reorganization effort, this proposal seems incomplete. Sections 505-20, 21, and 25 seem to be left out.

(Log #2265)

14- 321 - (505): Reject
SUBMITTER: David Wechsler, Union Carbide Corp.
RECOMMENDATION: Delete "Class I" before the term zone, in all 13 places that it appears within the NEC. Thus, for example, "Class I, Zone 1" would now become simply "Zone 1."
SUBSTANTIATION: Unlike the US Class-Division methodology where a division could apply to flammable gases or to combustible dusts, and thus required the "Class" for appropriate understanding, "Zone 0," "Zone 1," "Zone 2" can only apply to Class I materials. Thus, the use of the term "Class I" before the "zone" term is unnecessary and extraneous since "Zone 0," "FZone 1," "Zone 2" apply only to Class I materials. If ever finalized and adopted, zones that address combustible dusts will have a different numbering system (i.e., Zone 20, 21, 22).
PANEL ACTION: Reject.
PANEL STATEMENT: Class I designation has been accepted for the past several code cycles and has been used successfully by manufacturers and product evaluation and testing organizations.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #37)

14- 322 - (505-3, FPN (New)): Reject
NOTE: The following proposal consists of Comment 14-72 on Proposal 14-281 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 14-281 was:

Revise as follows:

505-3. Special Precaution. Article 505 requires equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.

(FPN No. 1): It is important that inspection authorities and users exercise more than ordinary care with regard to installation and maintenance of electrical equipment in hazardous (classified) locations.

(FPN No. 2): Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by 505-2(c)1 may not be suitable for use at temperatures lower than -20°C (-13°F) unless they are approved for use at lower temperatures. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.

(a) Supervision of Work. Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer.

(b) Dual Classification. Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations.

(c) Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1 or Zone 2 location provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.
SUBMITTER: Zdena Zajickova, World Safety Org.
RECOMMENDATION: Add Fine Print Note following 505-3 statement:
"Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer."
(FPN): The term "Qualified Registered Professional Engineer" may be considered applicable to qualified members of the World Safety Organization certified by the WSO Professional Certification Board.
SUBSTANTIATION: The World Safety Organization (WSO) is in Consultative Status Category II (nongovernmental) with the United Nations; and as such is fully recognized throughout the world as a professional organization. Its roster includes over 14,000 members, 1500 national and multinational companies/corporations, and 184 nations. Also included are over 2,000 professionals who are both nationally and internationally certified practitioners in the safety, health and environmental vocations. Since 1975, this organization has been strongly committed to the protection of people, property, resources and the environment. The WSO mandates an evaluation of its members mastery of safety knowledge and application; to include their professional and ethical behavior. Strict standards of professional performance are applied to ensure that WSO certified members, practicing safety, have attained a level of professionalism required to meet or exceed the needs of Government, commerce, and industry on both national and international levels. I have provided more information about the WSO and our certification exams, policy, and program.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: See Proposal 14-348, which deletes this section.

NOT RETURNED: 2 Earley, Saban

(Log #3020)

14- 323 - (505-3(a), FPN No. 2): Accept in Principle
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Replace "nonhazardous" with "unclassified."
SUBSTANTIATION: This is a companion proposal to other proposals which provide a definition of unclassified in Articles 100, 500, and 505, and provides correlation. The term "Classified" refers to the type of material/hazard potential involved, i.e., Class I, Division 1, Class II, Division 2, etc. Terms such as nonhazardous and unclassified are used in both the NEC, the Uniform Building Code (UBC), and other NFPA documents. The term nonhazardous infers that the area has "no" hazards while the term "unclassified" more clearly correlates with the condition of being reviewed but found not to need classification. This action provides needed correlation with other NFPA documents, such as NFPA 497. Additionally the term "nonhazardous" is used 7 times within various parts of the NEC, and in at least one place in the NEC the meaning of nonhazardous applies to voltages and not classification. A companion proposal has been made to change the term "nonhazardous" to "unclassified" as appropriate elsewhere in the NEC.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-318a addresses this issue.

(Log #3984)

14- 324 - (505-3(b)(1)): Accept in Principle
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise text to read as follows:
505-3(b)(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings. For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, conduit fittings, or cable fittings shall be used. Threaded entries into flameproof or explosionproof enclosures shall be made up with at least five threads fully engaged.
SUBSTANTIATION: This proposal is the work of a Task Group including Ed Briesch, Bill Lawrence, Dave Wechsler, Lon Ballard, Larry Fuhrman, and Will McBride. This Task Group was not balloted. The purpose of the proposal is to provide clear guidelines for wiring, sealing, and installation in Article 505, without having to refer to Article 501.
PANEL ACTION: Accept in Principle.

14- 332 - (505-4(d)): Reject
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: Revise as follows:
(d) Type of Protection "n." This protection technique shall be permitted for equipment in those Class 1, Zone 2 locations for which it is approved. Type of protection "n" is further subdivided into nA, nC, nL, and nR.
FPN No. 1: See Table 505-10(b) (1) for the descriptions of subdivisions for type of protection "n".
FPN No. 2: Type "n" protection is a type of protection applied to electrical equipment such that, in normal operation, the electrical equipment is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.
FPN No. 3: For further information, see Electrical Apparatus for Explosive Gas Atmospheres, Part 15 - Electrical Apparatus with Type of Protection "n" IEC 79-15-1987.

Table 505-10(b)1

Designation	Technique	Zone*
d	Flameproof Enclosure	1
e	Increased safety	1
ia	Intrinsic safety	0
ib	Intrinsic safety	1
[ia]	Intrinsically safe associated apparatus	Nonhazardous
[ib]	Intrinsically safe associated apparatus	Nonhazardous
m	Encapsulation	1
nA	Nonsparking equipment	2
nC	Sparking equipment in which the contacts are suitably protected other than by restricted-breathing enclosure, and energy limitation.	2
nL	energy-limited equipment.	2
nR	Restricted breathing enclosure	2
o	Oil immersion	1
P	Purged and pressurized	1 or 2
q	Powder filled	1

*Does not address use where a combination of techniques is used.

SUBSTANTIATION: The draft IEC 60079-15 which is currently being prepared as an FDIS and on which ISA S12.12.02 will be based has an extra category for Type N apparatus. This is Ex nL of Energy limited. This concept is similar to the nonincendive field wiring apparatus currently permitted in Article 501-4(b) of the 1999 National Electrical Code.

FPN No. 2: Type "n" protection is a type of protection applied to electrical equipment such that, in normal operation, the electrical equipment is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.
FPN No. 3: For further information, see Electrical Apparatus for Explosive Gas Atmospheres, Part 15 — Electrical Apparatus with Type of Protection "n," IEC 60079-15.
SUBSTANTIATION: The addition of the "nL" for Energy Limited Apparatus is necessary as this is included within the next edition of IEC60079-15. IEC60079-15 will shortly be published as an FDIS and will be available by the time the 2002 Code is published.
PANEL ACTION: Reject.
PANEL STATEMENT: The referenced document is not yet published.

14- 344 - (505-6): Accept in Principle
Note: The Technical Correlating Committee directs that the Panel clarify the Panel Action and Panel Statement on this Proposal. It is not clear what is meant by the statement "The referenced document is not yet published." This action will be considered by the Panel as a Public Comment.
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise text to read as follows:
505-6. Special Precaution. Article 505 requires equipment construction and installation that will ensure safe performance under conditions of proper use and maintenance.
FPN No. 1: It is important that inspection authorities and users exercise more than ordinary care with regard to the installation and maintenance of electrical equipment in hazardous (classified) locations.
FPN No. 2: Low ambient conditions require special consideration. Electrical equipment depending on the protection techniques described by Section 505-4(a) may not be suitable for use at temperatures lower than -20°C (-13°F) unless they are approved for use at lower temperatures. However, at low ambient temperatures, flammable concentrations of vapors may not exist in a location classified Class I, Zones 0, 1, or 2 at normal ambient temperature.
(a) Supervision of Work. Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified Registered Professional Engineer.
(b) Dual Classification. In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abutt, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abutt Class I, Division 1 or Division 2 locations.
(c) Reclassification Permitted. A Class I, Division 1 or Division 2 location shall be permitted to be reclassified as a Class I, Zone 0, Zone 1, or Zone 2 location provided all of the space that is classified because of a single flammable gas or vapor source is reclassified under the requirements of this article.
(d) Solid Obstacles. Flameproof equipment with flanged joints shall not be installed such that the flange openings are closer than the distances shown in Table ~~505-15~~ 505-6 to any solid obstacle that is not a part of the equipment (such as steelworks, walls, weather guards, mounting brackets, pipes, or other electrical equipment) unless the equipment is listed for a smaller distance of separation.
Table ~~505-15.~~ 505-6. Minimum Distance of Obstructions from Flameproof "d" Flange Openings

	Minimum Distance	
Gas Group	in.	mm
IIC	1 37/64	40
IIB	1 3/16	30
IIA	25/64	10

SUBSTANTIATION: This proposal is the work of a Task Group including Ed Briesch, Bill Lawrence, Dave Wechsler, Lon Ballard, Larry Fuhrman, and Will McBride. This Task Group was not balloted. The purpose is to provide clear guidelines for wiring, sealing, and installation in Article 505, without having to refer to Article 501.
PANEL ACTION: Accept in Principle.

(Log #386)

14- 347 - (505-6(a)): Reject
SUBMITTER: Vojtech D. Ackerman, Bechtel Corp.
RECOMMENDATION: Revise 505-6(a) to read as follows:
(a) Supervision of Work. Classification of areas and selection of equipment and wiring methods shall be under the supervision of a qualified licensed ~~Registered~~ Professional Engineer.
SUBSTANTIATION: Texas legislature (Senate Bill 623/1997) changed the standard terminology from that of "Registered Engineer" to "Licensed Engineer."
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: See Proposal 14-348, which deletes this section.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I disagree with Panel Action on Proposal 14-348 and would agree to include both licensed or registered to describe the term used in various locations for certifying Professional Engineers.

(Log #3021)

14- 348 - (505-6(a)): Accept
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Delete 505-6(a) and renumber accordingly.
SUBSTANTIATION: The term "qualified registered professional engineer" was introduced into the 1996 NEC as a means of controlling the design under the then newly introduced concept of the US "Zone 0" classification methodology. At that time, information was not as well defined as the current NEC is, and the need to have this type of supervision, as compared with the traditional location area electrical classification and other NEC installations, does not warrant the continued restriction.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
NEGATIVE: 4
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I disagree with proposal, substantiation, and Panel Action. Since the inclusion of Article 505 in the 1996 NEC, IAEI has been part of CMP-14 Task Groups for Article 505. UL 2279 Industry Advisory Groups, and two code cycles for CMP-14 and have been made aware of one job that has used Article 505. I am sure that there may have been some additional small scale uses of the zone system, but that could not be considered widespread use of the system. This major project experienced major challenges, even for the the qualified registered Professional Engineers supervising. To remove this level of accountability would not be in the best interest of safety at this time. For those that are truly interested in giving the zone system a chance to succeed in this country, I believe that we should proceed with caution.
GOODMAN: The removal of the entire section for "Supervision of Work" while the NEC requirements for Article 505 are still evolving is not yet warranted. The work as described in the current section should be done "under the supervision of a qualified engineer".
OMEARA: This proposal should be rejected and the existing requirements for a "qualified registered professional engineer" remain in the code, as the concept of zones is not yet in widespread use.
WELDON: The term "qualified registered professional engineer" should remain in the code for at least one more cycle. The complexities of the introduction of Zone 0 into the code are not sufficiently understood within the industry to remove this protective language. The language does no harm while raising the newness of the Zone 0 concept in user's minds. I believe more training programs and more experience in the field by designers, as well as craftsmen, is needed to raise the levels of understanding required to ensure safe installations.

(Log #4419)

14- 349 - (505-7(c)): Accept in Principle
SUBMITTER: Jeffrey M. Shapiro, Int'l Code Consultants/Rep. Int'l Inst. of Ammonia Refrigeration
RECOMMENDATION: Revise text to read as follows:
505.7(c) Group IIA. Atmospheres containing acetone, ammonia, ethyl alcohol, gasoline, methane, propane, or flammable gas, flammable liquid-produced vapor, or combustible liquid-produced vapor mixed with air that may burn or explode, having either a maximum experiment safe gap (MESG) value greater than 0.90 mm or minimum igniting current ratio (MIC ratio) greater than 0.80.
Exception: Areas containing ammonia refrigeration equipment shall be permitted to be classified as nonhazardous locations when (1) continuous mechanical ventilation is provided and failure of the ventilation system actuates an alarm, or (2) vapor detection is provided to automatically activate a mechanical ventilation system and sound an alarm at a detection threshold of 1,000 parts-per-million or less.
FPN: Group IIA is equivalent to Class I, Group D as described in Section 500.5(a)(4).
SUBSTANTIATION: The purpose of this proposal is to clarify application of the code and to make the Class/Zone approach match the Class/Division approach with respect to electrical equipment in ares where ammonia refrigeration systems are present. An exception similar to the one proposed here has been in Section 500.5(a)(4) for Class/Division designations for quite some time, and a proposal has been submitted to revise that exception to exactly match this one in an effort to comprehensively improve the code.
Although the simple fix to this section would have been to simply duplicate the existing exception in Section 500.5(a)(4) here, it seemed more appropraite to fix both sections at once. The existing exception in Section 500.5(a)(4), being somewhat vague, unnecessarily complicates enforcement and introduces the opportunity for inconsistent application of the code for cases involving ammonia refrigeration systems. The intent of that exception, which is established through Section 500.5(a)(4) FPN No. 4, is to permit a reduction in the hazard classification for ammonia based on prescriptive allowances in ASHRAE 15.
The referenced provisions in ASHRAE 15 are set forth in Sections 8.14(g) and (h) of that document, which provide the following:
"(g) When refrigerants of Groups A2, A3, B2, and B3 are used, the machinery room shall conform to Class I, Division 2 of the National Electrical Code. When refrigerant Groups A1 and B1 are used, the machinery room is not required to meet Class I, Division 2 of the National Electrical Code.
Exception: When ammonia is used, the requirements of Class I, Division 2 of the National Electrical Code shall not apply providing the requirements of 8.14(h) are met.
(h) When ammonia is used, the machinery room is not required to meet Class I, Division 2 of the National Electrical Code providing (1) the mechanical ventilation system in the machinery room is run continuously and failure of the mechanical ventilation system actuates an alarm or (2) the machinery room is equipped with a vapor detector that will automatically start the mechanical ventilation system and actuate an alarm at a detection level not to exceed 1,000 ppm."
Unlike many gases that support combustion [Lower Explosive Limit (LEL)] at concentrations of 10,000 to 20,000 parts per million (ppm), ammonia is not ignitable until the concentration reaches approximately 150,000 ppm. Because ammonia has a low propensity toward ignition, having such a high LEL, a narrow flammable range and a high required ignition energy, the U.S. Department of Transportation and other code writing organizations do not regulate ammonia as a "flammable gas" even though it can support combustion in limited circumstances.
The existing exception for ammonia in Section 500.5(a)(4) has been regarded as necessary to clarify that areas containing ammonia refrigeration equipment should be classified as nonhazardous locations when controls specified in ASHRAE 15 are followed because of ammonia's unique properties. Since the technical aspects of ASHRAE 15's provisions related to classified locations are fairly short, it seems more appropriate to provide these regulations with NFPA 70 as opposed to forcing the code user to reference another standard (the proponent has contacted ASHRAE to acquire permission to include the conceptual information from ASHRAE 15 in the NEC based on this proposal). This will make the NEC easier to apply and more definitive in its application.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-318a addresses this issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

(Log #2393)

14- 350 - (505-9(b)(4), FPN No. 1): Accept
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: In the first sentence, change "operations" to "operation." In the final sentence, change "seats" to "seals."
SUBSTANTIATION: To correct apparent typographical errors.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #3418)

14- 351 - (505-9(c)(5) (New)): Reject
SUBMITTER: Nicholas T. Abbatiello, Spencerport, NY
RECOMMENDATION: Add a subparagraph (5) to read:
"Locations, within enclosed equipment and machines in industrial establishments where the conditions of design, maintenance and supervision ensure that only qualified persons will build and service the installation, not complying with (1) through (4) above which otherwise would be designated as Zone 1 shall be permitted to be classified to Zone 2;
(i) when maintained at or below 25 percent of the Lower Flammable Limit, or
(ii) where the electrical equipment not rated for Division 1 but only rated for Division 2, is reliably interlocked by Listed and Labeled flammable gas detectors which will deenergize the equipment if 60 percent of the Lower Flammable Limit is exceeded. Consideration shall be given to rate at which the concentration can reach 100 percent versus the time for the deenergized equipment to come to a safe state.
FPN: For additional information, refer to NFPA 69-1997, Explosion Prevention Systems, and ISA S84.01-1996, Application of Safety Instrumented Systems for Process Industries."
SUBSTANTIATION: The current requirements do not address machinery interiors where protection against hazards, such as deflagration, by concentration reduction of the flammable gas or vapor. NFPA 34, Flammable or Combustible Liquids, Dipping and Coating Process, 1995, and Article 516, Spray Application, Dipping, and Coating Processes require interiors to be Zone 1. NFPA 69 recognizes the 25 percent or below control and above 60 percent deenergization for protection against deflagration. Why can't there then be allowance for Zone 2 equipment since the concentration is not normally flammable? This would provide equivalent safety as the likelihood, rather than the consequence, of an ignition in explosionproof equipment is reduced.
PANEL ACTION: Reject.
PANEL STATEMENT: The text proposed is too vague. The submitter has not addressed all of the issues pertinent to area classification when using gas detection equipment, as detailed in the referenced standards.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #3022)

14- 352 - (505-9(d) (New)): Accept in Principle
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Add the following text:
505-9(d) Unclassified Locations. Locations which are neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.
SUBSTANTIATION: The term "classified" refers to the type of material/hazard potential involved, i.e., Class I, Division 1, Class II, Division 2, etc. Terms such as nonhazardous and unclassified are used in both the NEC and other NFPA documents. The term nonhazardous infers that the area has "no" hazards while the term "unclassified" more clearly correlates with the condition of being reviewed but found not to need classification. This action provides needed correlation with other NFPA documents, such as NFPA 497. A companion proposal has been made to change the term "nonhazardous" to "unclassified" elsewhere in the NEC and to define this term in Article 500.
PANEL ACTION: Accept in Principle.
Add new definitions of "Unclassified" and "Nonhazardous" to read as follows:
"Unclassified Locations. Locations that have been evaluated by the classification process defined in Section 500-35(a) or Section 505-3 5 (a) and determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof."
"Nonhazardous Locations. Locations which are not required to have been evaluated by the process defined in 500-5 (a) or 505-5(a)."
PANEL STATEMENT: The panel agrees with the submittal and believes that the classification process results in not one definition, but two: the one provided by the submitter for "unclassified" and the second for "nonhazardous".
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: The panel action should be "Accept". See my comments on Proposal 14-2a.
GOODMAN: This proposal should be "Accept" and not "Accept in Principle". The Panel Action is contrary to the submitter's intent and justification with respect to the use of the term "Unclassified". This proposal along with the other companion proposals referenced in the submitter's substantiation are designed to remove the term "nonhazardous" from the NEC, not add and define the term and definition. Also see comments under Proposal 14-18a.

(Log #1810)

14- 353 - (505-10(b), FPN (New)): Reject
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: Add a fine print note to read as follows:
FPN: Where the equipment is marked with a certificate number the format of the certificate number is in the form AEx XYZ 02 0123. Where XYZ represents the NRTL issuing the certificate, the first two digits represent the year of issue of the certificate and the final four digits represent the index number of the certificate. A suffix X represents Special Conditions of Installation or Use, or a suffix U indicates that the product is an Ex Component.
SUBSTANTIATION: The IEC 60079 Series of standards, on which the ANSI/ISA S12 series of standards, and ANSI/UL2279 are both based, require a certificate number as part of the apparatus marking. ISA and UL have both taken this requirement out of their versions of the Zone standards. Manufacturers are increasingly asking for certificates as evidence to users that the product is Listed. If the format of the certificate number is consistent between the NRTLs, then the users and the AHJs, will be able to find the information needed quickly, especially on items such as Ex components. See also proposal on 110(3)(b).
PANEL ACTION: Reject.
PANEL STATEMENT: This is not an installation issue.

(Log #1636)

14- 354 - (505-10(b)(1)): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise the first sentence to read as follows:
Equipment ~~approved~~ (identified) for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with Section 500-5(d), be permitted to be marked with the following:.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

(Log #3019)

14- 356 - (Table 505-10(b)(1)): Accept in Principle

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Replace "nonhazardous" with "unclassified" (2 places).

SUBSTANTIATION: This is a companion proposal to other proposals which provide a definition of unclassified in Articles 100, 500, and 505, and provides correlation. The term "Classified" refers to the type of material/hazard potential involved, i.e., Class I, Division 1, Class II, Division 2, etc. Terms such as nonhazardous and unclassified are used in both the NEC, the Uniform Building Code (UBC), and other NFPA documents. The term nonhazardous infers that the area has "no" hazards while the term "unclassified" more clearly correlates with the condition of being reviewed but found not to need classification. This action provides needed correlation with other NFPA documents, such as NFPA 497. Additionally the term "nonhazardous" is used 7 times within various parts of the NEC, and in at least one place in the NEC the meaning of nonhazardous applies to voltages and not classification. A companion proposal has been made to change the term "nonhazardous" to "unclassified" as appropriate elsewhere in the NEC.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Proposal 14-318a addresses this issue.

(Log #4240)

14- 357 - (Figure 505-10(b)(1)): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Rename this drawing "Figure 505-10(b)(2)".

SUBSTANTIATION: This is the subject of Section 505-10(b)(2) FPN No. 2. Due to a printing layout error in the first printing, it appears on a different page, resulting in widespread confusion. Although that is a printing error, NFPA staff, in my opinion, can be forgiven on this one since its subject is far more intimately connected with the second paragraph. If it were properly named by the panel, it probably would have been printed in its proper location. In fact, it might be titled "Figure 505-10(b)(2) FPN No. 2".

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The Figure will be correctly numbered in accordance with the editorial rewrite.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #1637)

14- 358 - (505-10(b)(3)): Accept in Principle in Part

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI

RECOMMENDATION: Revise the first sentence to read as follows:

~~Approved~~ (identified) equipment shall be marked to show the operating temperature or temperature range referenced to a 40°C (104°F) ambient.

SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

PANEL ACTION: Accept in Principle in Part.

Delete the word "approved" and change "temperature range" to "temperature class"

PANEL STATEMENT: There is no need to use "approved" because all equipment covered by Article 505 is required to be listed. The change related to temperature class is to correlate with other editorial changes.

14- 363 - (505-15):
Note: It was the action of the Technical Correlating Committee that this Proposal be reported as Reject to correlate with the action of the Technical Correlating Committee on Proposal 14-364.
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise the entire 505-15 as follows:
505-15. Wiring Methods. Wiring methods shall maintain the integrity of protection techniques and shall comply with (a), (b), or (c).
(a) Class I, Zone 0. In Class I, Zone 0 locations, only intrinsically safe wiring methods in accordance with Article 504 shall be permitted.
FPN: Article 504 only includes protection technique "ia."
(b) Class I, Zone 1. In Class I, Zone 1 locations, the following wiring methods shall be permitted:
(1) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.
Exception No. 1: Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade.
Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.
(2) Type MI cable with termination fittings listed for Class I, Zone 1 or Division 1. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
Exception No. 1: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC-HL cable, listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated aluminum sheath, an overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.
FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC-HL cable.
Exception No. 2: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, listed Type ITC-HL cable with a gas/vaportight continuous corrugated aluminum sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application shall be permitted.
Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord installed in accordance with the provisions of Section 505-17 shall be permitted.
(c) Class I, Zone 2. In Class I, Zone 2 locations, ~~apply~~ the following wiring methods shall be permitted:
(1) Threaded rigid metal conduit, threaded steel intermediate metal conduit,
(2) enclosed gasketed busways, enclosed gasketed wireways,
(3) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.
(4) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;
(5) Types MI, MC, MV, or TC cable with approved termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings.
Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with approved fittings, or flexible cord approved for extra-hard usage and provided with approved bushed fittings shall be permitted. An additional conductor for grounding shall be included in the flexible cord.
FPN: See Section 505-25(b) for grounding requirements where flexible conduit is used.
SUBSTANTIATION: This proposal is the word of a Task Group including Ed Briesch, Bill Lawrence, Dave Wechsler, Lon Ballard, Larry Fuhrman, and Will McBride. This Task Group was not balloted. The purpose of the proposal is to provide clear guidelines for wiring, sealing, and installation in Article 505, without having to refer to Article 501.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-364 addresses these issues.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban
COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #4392)

14- 364 - (505-15):

Note: It was the action of the Technical Correlating Committee that this Proposal be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.

SUBMITTER: Joseph H. Kuczka, W. McBride/ H. Bockle, Killark Electric Mfg. Co./ARCO/Killark-Stahl, Inc.

RECOMMENDATION: This proposal is a revision to the proposal submitted by the Task Group that was established by the Chairman of CMP-14. Replace the wording of the Task Group for this section with the wording of this proposal:

505.15. Wiring Methods. Wiring methods shall maintain the integrity of protection techniques and shall comply with (a), (b), or (c).

(a) Class I, Zone 0. In Class I, Zone 0 locations, only intrinsically safe wiring methods in accordance with Article 504 shall be permitted.

FPN: Article 504 only includes protection technique "ia."

(b) Class I, Zone 1. In Class I, Zone 1 locations, the following wiring methods shall be permitted.

(1) Type MC-HL cable, or ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated aluminum sheath, and overall jacket of suitable polymeric material, separate grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.

FPN: See Sections 334.3 and 334.4 for restrictions on use of Type MC-HL cable.

Exception No. 1: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, listed Type TC cable with a gas/vaportight overall jacket of suitable polymeric material, complying with the requirements of Article 340.4(6), with separate grounding conductors in accordance with Section 250.122, and provided with termination fittings listed for the application shall be permitted between enclosures utilizing the increased safety method of protection technique "e", within the Zone 1 location.

(2) Type MI cable with termination fittings approved for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(3) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

Exception No. 1: Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade.

Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord installed in accordance with the provisions of Section 505.17 shall be permitted.

(c) Class I, Zone 2. In Class I, Zone 2 locations, the following wiring methods shall be permitted:

(1) Types MI, MC, MV, or TC cable with approved termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings.

(2) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use.

(3) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings.

(4) Enclosed gasketed busways, enclosed gasketed wireways.

(5) Threaded rigid metal conduit, threaded steel intermediate metal conduit,

Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible metal conduit with approved fittings, liquidtight flexible nonmetallic conduit with approved fittings, or flexible cord approved for extra-hard usage and provided with approved bushed fittings shall be permitted. An additional conductor for grounding shall be included in the flexible cord.

FPN: See Section 505.25(b) for grounding requirements where flexible conduit is used.

SUBSTANTIATION: 1. Changes concerning MC-HL and ITC-HL Cables.

(a) The wiring methods for Class I, Zone 1 have been reorganized listing MC-HL and ITC-HL cable first because in Class I, Zone 1 locations, cable is the primary wiring method.

(b) The permission to use MC-HL and ITC-HL cables in Class I, Zone 1 locations has been changed from Exceptions to the main body of the text. Since cable is the primary wiring method in Class I, Zone 1 locations, it does not make sense to list them as exceptions.

(c) The restriction for MC-HL and ITC-HL of using only "in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation" has been removed from the Exceptions for these cables. There is no reason to maintain this restriction in the text, since the level of risk in a Class I, Zone 1 location is not as great as in a Class I, Division 1 location, and in addition, in the Zone System, the classification, of areas, selection of equipment and wiring methods must be under the supervision of a qualified, Registered Professional Engineer. Cable is the preferred wiring method in Class I, Zone 1 locations of knowledgeable users, and is at least as safe as a conduit system.

(d) The Exception to Types MC-HL and ITC-HL cables recognizes and permits the use of a special Tray Cable that meets the requirements of Article 340.4(6) between enclosures within Class I, Zone 1 that use the type of protection increased safety. This type of cable is appropriate for connection between enclosures utilizing the type of protection "e" since this type of protection does not contain a source of ignition. TC cables complying with Article 340.4(6) must meet the crush and impact requirements of Type MC cable, cannot be located where it is subject to physical damage and must be identified for use. The Exception to permit this specific Type TC cable between enclosures with type protection "e" is an important Exception because it recognizes perhaps the most important wiring method in Class I, Zone 1 locations. The wiring methods of Class I, Zone 1 locations are Increased Safety, Flameproof and Intrinsic Safety, and without this exception, the wiring methods would not be complete.

This wiring method recognizes the important fact of the Zone System that Class I, Zone 1 does not have the same level of risk as Class I, Division 1 locations. A cable that meets the crush and impact requirements of MC cable, must be protected from physical abuse, can only be used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation and where the Classification of areas, selection of equipment and wiring methods are under the supervision of a qualified Registered Professional Engineer is not a source of ignition and is safe for connection between enclosures using the type of protection "e". The level of protection afforded by this type of TC cable is consistent with the level of protection provided by enclosures with type of protection "e".

2. Changes for Class I, Zone 2. The wiring methods of Class I, Zone 2 are essentially the same as Class I, Division 2 except the methods have been reorganized to have cable types listed first and also presented in a numerical list for clarity, rather than grouped together in one continuous paragraph.

The Exception for Nonincendive field wiring was not included since Nonincendive is not included in the Zone Protection Techniques.

PANEL ACTION: Accept in Principle.

Revise 505-15 to read:

"505-15. Wiring Methods. Wiring methods shall maintain the integrity of protection techniques and shall comply with (a), (b), or (c).

(a) Class I, Zone 0. In Class I, Zone 0 locations, only intrinsically safe wiring methods in accordance with Article 504 shall be permitted.

FPN: Article 504 only includes protection technique "ia."

(b) Class I, Zone 1.

(1) In Class I, Zone 1 locations, the following wiring methods shall be permitted:

(a) Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, separate equipment grounding conductors in accordance with Section 250-122, and provided with termination fittings listed for the application.

FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

(b) Type ITC-HL cable listed for use in Class I, Zone 1 or

Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material and provided with termination fittings listed for the application.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and where the cable is not subject to physical damage, Type TC cable shall be permitted if listed as suitable for use as open wiring and provided with a gas/vaportight overall jacket of suitable polymeric material and provided with separate equipment grounding conductors in accordance with Section 250-122. Cable termination fittings shall be listed for the application. The open wiring shall not exceed lengths of 15 feet.

FPN: Type TC cable listed for use as open wiring meets the crush and impact requirements of Type MC cable.

(d) Type MI cable with termination fittings approved for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Rigid nonmetallic conduit complying with Article 347 shall be permitted where encased in a concrete envelope a minimum of 2 in. (50.8 mm) thick and provided with not less than 24 in. (610 mm) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 24 in. (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

(2) Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations or flexible cord in accordance with the provisions of Section 505-17 shall be permitted.

(3) All boxes and fittings shall be listed for Class I, Zone 1 or identified for Class I, Division 1.

(c) Class I, Zone 2.

(1) In Class I, Zone 2 locations, the following wiring methods shall be permitted:

(a) Types MI, MC, MV, or TC cable with listed termination fittings, or in cable tray systems and installed in a manner to avoid tensile stress at the termination fittings;

(b) Type ITC cable in cable trays, in raceways, supported by messenger wire, afforded mechanical protection and run as open wiring, or directly buried where the cable is listed for this use;

(c) Type PLTC cable in accordance with the provisions of Article 725, or in cable tray systems. PLTC shall be installed in a manner to avoid tensile stress at the termination fittings;

(d) enclosed gasketed busways, enclosed gasketed wireways;

(e) threaded rigid metal conduit, threaded steel intermediate metal conduit;

(f) Nonincendive field wiring using any of the wiring methods suitable for nonhazardous locations, including Chapter 7 and 8 wiring methods.

(2) Where provision must be made for limited flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord listed for extra-hard usage and provided with listed bushed fittings shall be used. An additional conductor for grounding shall be included in the flexible cord.

FPN: See Section 505-25(b) for grounding requirements where flexible conduit is used."

PANEL STATEMENT: A. Changes concerning MC-HL and ITC-HL Cables.

a). Cable is the preferred wiring method in Class I, Zone 1 locations for knowledgeable users, and is at least as safe as a conduit system.

b). The wiring methods for Class I, Zone 1 have been reorganized listing MC-HL cable first because in Class I, Zone 1 locations, cable is the primary wiring method. ITC-HL Cable was separated from MC-HL cable to avoid requiring the separate equipment grounding conductor in ITC-HL Cable.

c). The restriction for MC-HL and ITC-HL of using only "in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation" has been removed from the Exception and inserted as positive language.

d). The Exception to types MC-HL, and ITC-HL cables recognizes and permits the use of a special Tray Cable that meets the requirements of Article 340-4(6), that is listed per UL Standard 1277 and marked as suitable as "Open Wiring". This special TC cable must meet the crush and impact requirements of type MC cable, cannot be located where it is subject to physical damage and must be identified for use (marked as suitable as "Open Wiring"). The wiring methods of Class I, Zone 1 locations are Increased Safety, Flameproof and Intrinsic Safety, and without this cable, the wiring methods would not be complete. Where this special Type TC Cable is connected to explosionproof or flameproof enclosures the cable will be terminated with a listed cable terminator that maintains the type of protection of the enclosure. (See Proposal 14-368.)

This wiring method recognizes the important fact of the Zone System that Class I, Zone 1 locations do not have the same level of risk as Class I, Division 1 locations. Special Type TC Cable that meets the crush and impact requirements of MC cable, must be protected from physical abuse, can only be used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation.

B. Changes concerning the use of the words "listed" and "identified"

a.) The word "approved" was changed to "listed" since all equipment and cables used in Zone areas is required to be "listed". (Where Division equipment is used in Zone areas, it shall be "identified".)

C. Changes for Class I Zone 2.

a.) The wiring methods of Class I, Zone 2 are essentially the same as Class I, Division 2 except the methods have been reorganized to have cable types listed first and also presented in a numerical list for clarity, rather than grouped together in one continuous paragraph.

b.) The exception for nonincendive field wiring has been modified and written in mandatory language.

c.) The language for provisions for flexibility was revised similar to 501-4 per Proposal 14-318a, rewrite of Article 501.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 5

NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

COOK: I agree with the regorganization of the section. I do not agree with removing the "in industrial establishments with restricted public access" restrictions on the MC-HL and ITC-HL cables. The purpose for this restriction was to keep these wiring methods out of the special occupancies, where regular maintenance is not as likely to occur and cables that might be damaged might not be noticed. Physical damage was a great concern when this wiring method was included in hazardous locations. I am no less concerned now. I also have great concern including TC cable in Zone 1 areas. Physical damage is a great concern for this wiring method and the crush and impact test of UL 1569 is much less severe than UL 2225.

GOODMAN: The majority of this proposal is acceptable and properly sets the requirements. However, the requirements under new Section 505-15(b)(1)(c) as contained in the Panel Action should not be accepted. This section allows the use of TC cable run as open wiring in a Zone 1 location in industrial establishments. There are several problems associated with this section and the Panel Action as follows:

1. The Panel Statement (d) references TC cable identified in Article 340-4(6). This Article pertains to open wiring in ordinary locations in industrial establishments and not Hazardous (Classified) Locations.

2. The 15 ft acceptable length of open wiring is arbitrary and without any substantiation.

3. The type TC cable proposed for Zone 1 is required to meet impact and crush requirements for MC cable. However, MC cable is not currently acceptable or even proposed to be acceptable in Zone 1 locations unless rated MC-HL. MC-HL cable must meet a more restrictive UL standard (UL 2225) than does MC (UL 1569).

4. Zone 1 MC-HL cable has a continuous corrugated gas/vaportight metallic sheath and an overall jacket. The proposed type TC cable has only a gas/vaportight overall jacket and is inherently inferior from a physical standpoint. Additionally, cuts, abrasions, or other physical damage will undermine the gas/vaportight integrity of the TC cable. There are also no production or field tests to ensure gas/vaportightness of the TC jacket.

5. The submitter requested approval for use of type TC cable in the connection of type protection "e" (increased safety) enclosures. The Panel Action capriciously and with no substantiation extended the acceptance to all protection types including "d" flameproof where the enclosure must withstand an internal explosion.

6. The term "not subject to physical abuse" has an excellent intent, but is very nebulous and does not offer the assurity necessary for classified Zone 1 locations.

7. The Panel substantiation states that "Zone 1 locations do not have the same level of risk as Division 1 locations" and implies that the considerably lesser TC cable should then be permitted. However, by definition, Zone 1 and Division 1 are literally identical "location in which ignitable concentrations of flammable gases or vapors are likely to exist under normal operating conditions".

8. There is no technical substantiation for the use of the TC cable in a Zone 1 location.

For the above reasons, the proposed Section 505-15(b)(1)(c) should be removed.

KUCZKA: Panel Action should have been Accept in Part. The Panel should have accepted the proposal except for 505-5(b)(1)(c) including the Fine Print Note. There is no fact finding report submitted supporting the use of Type TC cable in Class I, Zone 1 simply because it is listed for use as open wiring.

LAWRENCE: Although I strongly support the reformatting of the section, the submitter's original limitations on the introduction of "open wiring" TC cable should be maintained, i.e., the limitation to six feet of "open wiring" and the limitation of only "e" to "e" connections. There is insufficient technical substantiation for the panel's action to expand the submitter's proposal.

ZIPSE: The Panel Action on 505-15 allows Type TC listed as open wiring to be used in a Zone 1 location. We believe this to be a potentially unsafe practice with insufficient technical documentation given to support the change. We believe that Zone 1 cables should continue to require a metallic armor until more evidence is presented to support a lesser requirement.

Cables and glands suitable for use in Division 1 and Zone 1 application requirements have been established in the United States and in Canada with existing Standards UL 2225 and CSA C22.2, No. 174. The performance requirements in these standards drastically exceed the MC requirements. (See the following comparison). The physical abuse requirements of crush and impact are higher than that required by TC cable suitable for open wiring. There are low temperature impact requirements and flame propagation requirements that are not required for TC or MC cables. The basis for these standards include the requirements of a gas/vaportight continuous sheath. This is not a requirement for Type MC or Type TC. The overall jacket of a type TC cable is gas/vaportight only by definition, not be a physical specification or description. The only requirement is that there are no defects “that are visible with a normal or corrected vision without magnification”. There are no electrical or mechanical tests to verify the reliability, gas/vaportight properties, or sheath continuity. There is also no easy way to confirm the condition of TC cable jacket after installation.

The concept that a TC cable listed for use as open wiring, that meets the crush and impact test of MC cable, and has the same physical withstand properties of ALL TYPES of MC is incorrect. Type MC cable with a gas/vaportight continuous corrugated aluminum sheath has a typical crush resistance value of 200 percent of the MC requirement as stated below:

CRUSH TEST – UL - 1569

Size	Typical - MC	Typical - CWCMC
#14	1000	2000
#2	2000	5000

The use of TC cable listed for open wiring that merely meets the MC requirements will reduce the physical crush margin of safety by 50 percent from that of the MC-HL cable currently allowed in Division 1 locations. TC cable that has crush and impact capabilities has an application in industry – but not in a Zone 1 classified location.

See the following Performance Requirement Comparison:

REQUIREMENTS OF HL TYPE MC CABLE

	Performance Requirements	
	UL – 2225	UL – 1569
	HL Type MC	Type MC
	Impact Test	
#14 AWG	25 ft pounds	15 ft pounds
#2 AWG	50 ft pounds	50 ft pounds
	Crush Test	
#14 AWG	1500lbf	1000lbf
#2 AWG	2000lbf	2000lbf
Low Temperature Impact at – 25°C	9lbft	Not Required
Flame Test	IEEE – 1202/FT4	UL – 1685
Identified separate Ground wire	Required	Not Required

(Log #3023)

14- 365 - (505-15(b)): Accept in Principle

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Add to end of first sentence:

...except that conductors of aluminum shall not be connected to apparatus with the type of protection "e."

SUBSTANTIATION: Per ISA S12.16.01-1998 (IEC 79-7 Mod) titled Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations Type of Protection – Increased Safety "e," Section 4.1 titled Terminals for external (field) connections, it states:

"Terminals for connection to external circuits shall be generously dimensioned to permit the effective connection of copper conductors of cross-section equal to at least that corresponding to the rated current of the electrical apparatus."

Annex I of the referenced ANSI standard provides the following reasoning for the requirement for copper conductors: Due to the U.S. experience with other-than-copper conductors, the importance of a reliable connection, and the need to use anti-oxidant materials that could compromise spacings, other conductor materials for field connections were prohibited.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: This has been addressed by the action on Proposal 14-181.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #1977)

14- 366 - (505-15(b), Exception (New)): Accept in Principle

SUBMITTER: Peter J. Schram, Delray Beach, FL

RECOMMENDATION: Add the following exception after the second paragraph of Section 505-15(b):

Exception: A cable entering an enclosure having type of protection "e" shall not be required to be sealed at the enclosure.

SUBSTANTIATION: There is no engineering reason for requiring a cable seal at the entrance to an increased safety enclosure. It was never the intent of CMP 14 to require a cable seal at the entrance to an increased safety enclosure. This is evident by the specific omission of cables from the third paragraph and from the FPN No. 1. Also see the ROC Comment 14-96a Panel Comment for the 1999 NEC processing. However a strict reading of the second paragraph of Section 505-15(b) and the referenced Section 501-5(d)(1) would seem to indicate a cable seal is required. This proposal is intended to correct this oversight in the 1999 NEC.

PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Proposal 14-368 addresses the concerns of the submitter. The submitter's exception has been placed in positive language in the revised section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #2531)

14- 367 - (505-15(c)): Reject
Note: The Technical Correlating Committee directs that the Panel clarify the Panel Statement on this Proposal. The Panel should address the technical merits of the proposal. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Nicholas Ludlam, Factory Mutual Research
RECOMMENDATION: (c) Zone 2. In Class I, Zone 2 locations, all wiring methods permitted for Class I, Division 2 locations shall be permitted. Sealing and drainage shall be provided in accordance with Sections 501-5(b), (c), (e), and (f), except where the term "Division 2" is used, "Zone 2" shall be substituted and where the term "Division 1" is used, "Zone 1" shall be substituted. Wiring methods shall maintain the integrity of protection techniques.
Exception: Energy-limited field wiring shall be permitted to be wired using any of the methods suitable for nonincendive field wiring.
SUBSTANTIATION: Energy limited circuits are similar in concept to nonincendive field wiring circuits. The relaxation permitted by 501-4(b) for nonincendive field wiring should also apply to Energy-limited field wiring.
PANEL ACTION: Reject.
PANEL STATEMENT: This introduces material from a standard that has not yet been published.

(Log #3986)

14- 368 - (505-16): Accept in Principle
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise text to read as follows:
505.16. Sealing and Drainage. ~~501-5. Sealing and Drainage.~~
Sealing in conduit and cable systems shall comply with (a) through ~~(f)~~(e). Sealing compound shall be of a type approved for the conditions and use. Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.
FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section ~~501-5(e)(2).~~ 505.16(c)(2)(b). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See ~~Section 501-5(c)(2).~~ 505.16(d)(2).
FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.
(a) Zone 0. In Class I, Zone 0 locations, seals shall be located as follows:
~~(1) Intrinsically safe wiring in accordance with Article 504.~~
~~FPN: Article 504 only includes protection technique "ia."~~
~~(2)~~ (1) Seals shall be provided within 10 ft (3.05 m) of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.
Exception: A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 12 in. (305 mm) beyond each boundary, shall not be required to be sealed, if the termination points of the unbroken conduit are in unclassified locations.
~~(3)~~ (2) Seals shall be provided on cables at the first point of termination after entry into the Zone 0 locations.
~~(4)~~ (3) Seals shall not be required to be explosionproof or flameproof.
(b) Zone 1. In Class I, Zone 1 locations, seals shall be located as follows:
(1) Conduit seals shall be provided for each conduit entering enclosures having type of protection "d" or "e".
Exception: Where the enclosure having type of protection "d" is marked to indicate that a seal is not required.
Conduit seals shall be provided for each conduit entering explosionproof equipment as follows.
(a) In each conduit entry into an explosionproof enclosure where either (1) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (2) the entry is 2-in. size or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.
Exception: Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are
1. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
2. Immersed in oil, or
3. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, approved for the location, and marked "factory sealed" or equivalent.
Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.
(b) Conduit seals shall be installed within 18 in. (457 mm) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.
(c) Where two or more explosionproof enclosures for which conduit seals are required under (b)(2) are connected by nipples or by runs of conduit not more than 36 in. (914 mm) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 18 in. (457 mm) from either enclosure.
(3) In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.
FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.
FPN No. 2: For further information, see NFPA 496, Standard for Purged and Pressurized Enclosures for Electrical Equipment, 1998 edition.
(4) In each conduit run leaving a Class I, Zone 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for approved explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 1 location.
Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Zone 1 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.
(5) Conduits contains cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the ~~Division~~ Zone 1 location after removing the jacket and any other coverings so that the sealing compound

will surround each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 18 in. (457 mm) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

(6) Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (d).

(7) Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with (d).

(8) Cables shall be sealed at the point at which they leave the Zone 1 location.

Exception: Where cable is sealed at the termination point.

(c) Zone 2. In Class I, Zone 2 locations, seals shall be located as follows:

(1) Conduit seals shall be located as follows

a. For connections to enclosures that are required to be flameproof or explosionproof, a conduit seal shall be provided in accordance with (b)(1) and (b)(2). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section ~~501-4(a).~~ 505.16(b).

2. In each conduit run passing from a Class I, ~~Division~~ Zone 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the ~~Division~~ Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the ~~Division~~ Zone 2 location, and a threaded connection shall be used at the sealing fitting. Except for approved explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the ~~Division~~ Zone 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, ~~Division~~ Zone 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, ~~Division~~ Zone 2 location into the unclassified location. T he unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, ~~Division~~ Zone 2 location shall not require a seal at the boundary.

FPN: For further information, refer to NFPA 496, Standard for Purged and Pressurized Enclosures for Electrical Equipment, 1998 edition.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, ~~Division~~ Zone 2 location into an unclassified location if the following conditions are met:

1. No part of the conduit system segment passes through a Class I, ~~Division~~ Zone 0 or Class I, Zone 1 location where the conduit contains unions, couplings, boxes, or fittings within 12 in> (305 mm) of the Class I, ~~Division~~ Zone 0 or Class I, Zone 1 location; and

2. The conduit system segment is located entirely in outdoor locations; and

3. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and

4. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and

5. The conduit system segment is sealed at its entry to each enclosure or fittings housing terminals, splices, or taps in Class I, ~~Division~~ Zone 2 locations.

(2) Cable seals shall be located as follows:

(a) Cables entering enclosures required to be flameproof or explosionproof ~~that are required to be approved for Class I locations~~ shall be sealed at the point of entrance. The seal shall comply with (d). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed ~~in an approved fitting~~ in the ~~Division~~ Zone 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (b)(4).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, ~~Division~~ Zone 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(b) Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapor through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (2)(a). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [0.007 ft^3/hr (198 cm^3/hr) of air at a pressure of 6 in. of water (1493 pascals).]

FPN No. 1: See ANSI/UL 886-1994, Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

(c) Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (2)(a), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water (1493 pascals) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, ~~Division~~ Zone 2 location without seals.

(d) Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the ~~Division~~ Zone 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

FPN: The cable sheath may be either metal or a nonmetallic material.

~~(c)~~ (d) Class I, ~~Divisions~~ Zones 0, 1 and 2. Where required, seals in Class I, ~~Divisions~~ Zones 0, 1 and 2 locations shall comply with the following:

(1) Fittings. Enclosures for connections or equipment shall be provided with an ~~approved~~ integral means for sealing, or sealing fittings ~~approved~~ for Class I locations shall be used. Sealing fittings shall be accessible.

(2) Compound. Sealing compound shall be approved and shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93°C (200°F).

(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 5/8 in. (16 mm).

Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.

(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

~~(5) Assemblies. In an assembly where equipment that may produce arcs, sparks, or high temperatures is located in a compartment separate from the compartment containing splices or taps, and an integral seal is provided where conductors pass from one compartment to the other, the entire assembly shall be approved for Class I locations. Seals in conduit connections to the~~

~~compartment containing splices or taps shall be provided in Class I, Division 1 locations where required by (a)(1)(b).~~

~~(6)~~ (5) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically listed for a higher percentage of fill.

(e) ~~(f)~~ Drainage.

1. Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

2. Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduits systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

3. Canned Pumps, Process or Service Connections, etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend upon a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical conduit system, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the conduit system beyond the additional devices or means, if they primary seal fails.

The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above.

Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.

SUBSTANTIATION: This proposal is the word of a Task Group including Ed Briesch, Bill Lawrence, Dave Wechsler, Lon Ballard, Larry Fuhrman, and Will McBride. This Task Group was not balloted. The purpose of this proposal is to provide clear guidelines for wiring, sealing, and installation in Article 505, without having to refer to Article 501.

PANEL ACTION: Accept in Principle.

Replace existing 505-16 with the following text.

505-16. Sealing and Drainage. Seals in conduit and cable systems shall comply with (a) through (e). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.

> FPN No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal, and through conductors passing through the seal. See Section 505-16(c)(2)(b). Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. See Section 505-16(d)(2).
>
> FPN No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than No. 2. Special conductor constructions, e.g., compacted strands or sealing of the individual strands, are means of reducing leakage and preventing the propagation of flames.

(a) Zone 0. In Class I, Zone 0 locations, seals shall be located as follows.

(1) Seals shall be provided within 10 ft (3.05 m) of where a conduit leaves a Zone 0 location. There shall be no unions, couplings, boxes, or fittings, except reducers at the seal, in the conduit run between the seal and the point at which the conduit leaves the location.

Exception: A rigid unbroken conduit that passes completely through the Zone 0 location with no fittings less than 12 in. (305 mm) beyond each boundary, shall not be required to be sealed, if the termination points of the unbroken conduit are in unclassified locations.

(2) Seals shall be provided on cables at the first point of termination after entry into the Zone 0 location.

(3) Seals shall not be required to be explosionproof or flameproof.

(b) Zone 1. In Class I, Zone 1 locations, seals shall be located as follows.

(1) Conduit seals shall be provided for each conduit entering enclosures having type of protection 'd' or 'e'.

Exception: Where the enclosure having type of protection 'd' is marked to indicate that a seal is not required.

Conduit seals shall be provided for each conduit entering explosionproof equipment as follows.

(a) In each conduit entry into an explosionproof enclosure where either (1) the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors, that may produce arcs, sparks, or high temperatures that are considered to be an ignition source in normal operation, or (2) the entry is 2-in. size or larger and the enclosure contains terminals, splices, or taps. For the purposes of this section high temperatures shall be considered to be any temperatures exceeding 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved.

Exception: Conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors are
1. Enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or
2. Immersed in oil, or
3. Enclosed within a factory-sealed explosionproof chamber located within the enclosure, approved for the location, and marked "factory sealed" or equivalent.

Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.

(b) Conduit seals shall be installed within 18 in. (457 mm) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.

(c) Where two or more explosionproof enclosures for which conduit seals are required under (b)(2) are connected by nipples or by runs of conduit not more than 36 in. (914 mm) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if located not more than 18 in. (457 mm) from either enclosure.

(3) In each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. Conduit seals shall be installed within 18 in. (457 mm) from the pressurized enclosure.

FPN No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.

FPN No. 2: For further information, see Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

(4) In each conduit run leaving a Class I, Zone 1 location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 1 portion of the conduit from being communicated to the conduit beyond the seal. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 1 location.

Exception: Metal conduit containing no unions, couplings, boxes, or fittings that passes completely through a Class I, Zone 1 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not require a conduit seal if the termination points of the unbroken conduit are in unclassified locations.

(5) Conduits containing cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 1 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 18 in. (457 mm) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. For shielded cables and twisted pair cables, it shall not be required to remove the shielding material or separate the twisted pair.

(6) Each multiconductor cable in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with (d).

(7) Cable seals shall be provided for each cable entering flameproof or explosionproof enclosures. The seal shall comply with (d).

(8) Cables shall be sealed at the point at which they leave the Zone 1 location.

Exception: Where cable is sealed at the termination point.

(c) Zone 2. In Class I, Zone 2 locations, seals shall be located as follows.

(1) Conduit seals shall be located as follows.

(a) For connections to enclosures that are required to be flameproof or explosionproof, a conduit seal shall be provided in accordance with (b)(1) and (b)(2). All portions of the conduit run or nipple between the seal and such enclosure shall comply with Section 505-16(b).

2. In each conduit run passing from a Class I, Zone 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 10 ft (3.05 m) of the boundary, and shall be designed and installed so to minimize the amount of gas or vapor within the Zone 2 portion of the conduit from being communicated to the conduit beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Zone 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Zone 2 location.

Exception No. 1: Metal conduit containing no unions, couplings, boxes or fittings that passes completely through a Class I, Zone 2 location with no fittings less than 12 in. (305 mm) beyond each boundary shall not be required to be sealed if the termination points of the unbroken conduit are in unclassified locations.

Exception No. 2: Conduit systems terminating at an unclassified location where a wiring method transition is made to cable tray, cablebus, ventilated busway, Type MI cable, or open wiring shall not be required to be sealed where passing from the Class I, Zone 2 location into the unclassified location. The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or room that is unclassified as a result of pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

FPN: For further information, refer to Standard for Purged and Pressurized Enclosures for Electrical Equipment, NFPA 496-1998.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Class I, Zone 2 location into an unclassified location if the following conditions are met:

1. No part of the conduit system segment passes through a Class I, Zone 0 or Class I, Zone 1 location where the conduit contains unions, couplings, boxes, or fittings within 12 in. (305 mm) of the Class I, Zone 0 or Class I, Zone 1 location; and

2. The conduit system segment is located entirely in outdoor locations; and

3. The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system; and

4. The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location; and

5. The conduit system segment is sealed at its entry to each enclosure or fitting housing terminals, splices, or taps in Class I, Zone 2 locations.

(2) Cable seals shall be located as follows.

(a) Cables entering enclosures required to be flameproof or explosionproof shall be sealed at the point of entrance. The seal shall comply with (d). Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be sealed in the Zone 2 location after removing the jacket and any other coverings so that the sealing compound will surround each individual insulated conductor in such a manner as to minimize the passage of gases and vapors. Multiconductor cables in conduit shall be sealed as described in (b)(4).

Exception No. 1: Cables passing from an enclosure or room that is unclassified as a result of Type Z pressurization into a Class I, Zone 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(b) Cables with a gas/vaportight continuous sheath and that will not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in (2)(a). The minimum length of such cable run shall not be less than that length that limits gas or vapor flow through the cable core to the rate permitted for seal fittings [0.007 ft3/hour (198 cm3/hour) of air at a pressure of 6 in. of water (1493 pascals)].

FPN No. 1: See Outlet Boxes and Fittings for Use in Hazardous (Classified) Locations, ANSI/UL 886-1994.

FPN No. 2: The cable core does not include the interstices of the conductor strands.

(c) Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall not be required to be sealed except as required in (2)(a), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 6 in. of water (1493 pascals) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified area.

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Zone 2 location without seals.

(d) Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Zone 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

FPN: The cable sheath may be either metal or a nonmetallic material.

(d) Class I, Zones 0, 1 and 2. Where required, seals in Class I, Zones 0, 1 and 2 locations shall comply with the following.

(1) Fittings. Enclosures for connections or equipment shall be provided with an integral means for sealing, or sealing fittings for Class I locations shall be used. Sealing fittings shall be accessible. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.
(2) Compound. The compound shall provide a seal against passage of gas or vapors through the seal fitting, shall not be affected by the surrounding atmosphere or liquids, and shall not have a melting point of less than 93ºC (200ºF).
(3) Thickness of Compounds. In a completed seal, the minimum thickness of the sealing compound shall not be less than the trade size of the sealing fitting and, in no case, less than 5/8 in. (16 mm).
Exception: Listed cable sealing fittings shall not be required to have a minimum thickness equal to the trade size of the fitting.
(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.
(5) Conductor Fill. The cross-sectional area of the conductors permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless it is specifically listed for a higher percentage of fill.

(e) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.
(2) Motors and Generators. Where the authority having jurisdiction judges that there is a probability that liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize entrance of liquid. If means to prevent accumulation or to permit periodic draining are judged necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.
(3) Canned Pumps, Process or Service Connections, Etc. For canned pumps, process or service connections for flow, pressure, or analysis measurement, etc., that depend upon a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the electrical conduit system, an additional approved seal, barrier, or other means shall be provided to prevent the flammable or combustible fluid from entering the conduit system beyond the additional devices or means, if the primary seal fails.
The additional approved seal or barrier and the interconnecting enclosure shall meet the temperature and pressure conditions to which they will be subjected upon failure of the primary seal, unless other approved means are provided to accomplish the purpose above.
Drains, vents, or other devices shall be provided so that primary seal leakage will be obvious.

PANEL STATEMENT: The proposed text has been editorially amended to correlate with the text in Article 501-5 and also reflects other changes made via other proposals. See also Proposal 14-318a.

14- 369 - (505-20(b), Exception): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise to read as follows:
Exception: Equipment ~~approved~~ (identified) for use in Class I, Division 1 or listed for use in Class I, Zone 0 locations for the same gas, or as permitted by Section 505-7(d) and with a suitable temperature rating shall be permitted.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

(Log #1737)

14- 373 - (505-20(e)): Reject
SUBMITTER: Jon Miller, Richard Poling, Detector Electronics Corp.
RECOMMENDATION: Add new Section 505-20(e) to read as follows:
(e) Permanently mounted combustible gas detection equipment may be used as a means for reducing the need for special electrical equipment when:
• combustible gas detection equipment is listed and marked both as performance tested and as suitable for use in hazardous (classified) locations,
• performance listed combustible gas detection equipment is installed in accordance with industrial practices,
• used in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, and
• appropriate alarms with ventilation or interlocks are provided.
FPN No. 1: For suggested minimum performance specifications and guidance in the selection of gas detection equipment, see ISA S12.13.01, Performance Requirements, Combustible Gas Detectors.
FPN No. 2: For suggested installation, operation and maintenance guidance, see RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments.
FPN No. 3: For guidance in the installation of gas detection equipment, see ANSI/API RP 505, Recommended Practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2.
SUBSTANTIATION: Equipment necessary to be placed in hazardous (classified) locations which cannot meet specific hazardous location protection techniques currently requires purged/pressurized protection techniques. This is not always possible or desirable under all installation considerations. For many years gas detection equipment has been used as a method of protection in petroleum facilities in accordance with ANSI/API RP 505, Recommended Practice for Classification of Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2 and within hazardous location facilities in Canada in accordance with the Canadian Electrical Code (CEC) with no reported incidents. Gas detection equipment is capable of providing indication of the presence of combustible gases prior to reaching lower explosive limits and is capable of providing alarms with ventilation or interlocks. To ensure proper gas detection equipment functionality under such critical conditions, an existing ISA standard S12.13.01, Performance Requirements, Combustible Gas Detectors, will provide guidance on gas detection equipment performance requirements and an existing ISA recommended practice RP12.13.02, Installation, Operation, and Maintenance of Combustible Gas Detection Instruments, will provide user guidance on the proper use of gas detection equipment. In conclusion, this additional method of protection should be considered for equipment which cannot meet the proper hazardous (classified) location requirements, but is necessary to be installed in such locations.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: While the panel agrees with the principle of selectively applying gas detection in Class I areas, the evaluation process that is required to support this complex operating condition extends beyond merely a simple installation requirement. The NEC is primarily an electrical installation document.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #3983)

14- 374 - (505-25):
Note: The Technical Correlating Committee directs the Panel to reconsider this Proposal and revise the 6 ft (1.83m) dimension in accordance with the Technical Correlating Committee's directive regarding metrication of the NEC. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and communicated to the Panel prior to the Panel Meeting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise the text to read as follows:
505-25. Grounding and Bonding. Grounding and bonding shall comply with Article 250 and the following additional requirements.
(a) Bonding. The locknut-bushing and double-locknut types of contacts shall not be depended on for bonding purposes, but bonding jumpers with proper fittings or other approved means of bonding shall be used. Such means of bonding shall apply to all intervening raceways, fittings, boxes, enclosures, etc., between Class I locations and the point of grounding for service equipment or point of grounding of a separately derived system.
Exception: The specific bonding means shall only be required to the nearest point where the grounded circuit conductor and the grounding electrode are connected together on the line side of the building or structure disconnecting means as specified in Sections 250-32(a), (b), and (c), provided the branch-circuit overcurrent protection is located on the load side of the disconnecting means.
FPN: See Section 250-100 for additional bonding requirements in hazardous (classified) locations.
(b) Types of Equipment Grounding Conductors. Where flexible metal conduit or liquidtight flexible metal conduit is used as permitted in Section 505-15(c) and is to be relied on to complete a sole equipment grounding path, it shall be installed with internal or external bonding jumpers in parallel with each conduit and complying with Section 250-102.
Exception: In Class I, Zone 2 locations, the bonding jumper shall be permitted to be deleted where all the following conditions are met.
a. Listed liquidtight flexible metal conduit 6 ft (1.83 m) or less in length, with fittings listed for grounding, is used.
b. Overcurrent protection in the circuit is limited to 10 amperes or less.
c. The load is not a power utilization load.
SUBSTANTIATION: This proposal is the work of a Task Group including Ed Briesch, Bill Lawrence, Dave Wechsler, Lon Ballard, Larry Fuhrman, and Will McBride. This Task Group was not balloted. The purpose of the proposal is to provide clear guidelines for wiring, sealing, and installation in Article 505, without having to refer to Article 501.
PANEL ACTION: Accept.

ARTICLE 511 — COMMERCIAL GARAGES, REPAIR AND STORAGE

(Log #1264)

14- 376 - (511): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Technical Correlating Committee National Electrical Code

In 511-4(a), Exception, change "2 ft (610 mm)" to "600 mm (24 in.)" in two places in this exception.

In 511-7(a), change "12 ft (3.66 m)" to "3.7 m (12 ft)".

In 511-7(b), change "12 ft (3.66 m)" to "3.7 m (12 ft)".

RECOMMENDATION: In 511-3(a)(6)(3), change "18 in. (457 mm)" to "450 mm (18 in.)" in the title and the body of this section.

In 511-9(c), change "6 in. (152 mm)" to "150 mm (6 in.)".

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Reject.

PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

KUCZKA: See my Explanation of Negative Vote on Proposal 14-10.

OMEARA: This proposal should be accepted, to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.

ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #CP1407)

14- 376a - (511 through 515): Accept

Note: It was the action of the Technical Correlating Committee that the Panel Action on this Proposal be correlated with the Article 511 rewrite in Proposal 14-377, the Article 513 rewrite in Proposal 14-417, the Article 514 rewrite in Proposal 14-454, and the Article 515 rewrite in Proposal 14-474. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 14

RECOMMENDATION: All changes based on text as reorganized by Proposals 14-377, 14-417, 14-454 and 14-474

1. 516 not included, most of the text that needed to be changed is extracted from NFPA 33, and also includes dust, which is problematic at this time for Zones.
2. Specific changes for 511 are:
a) 511-4; (a) After "Article 501" add "or Article 505 for the Division or Zone in which they are used".
b) 511-4; (b) Same change as (a)
c) 511-9; After "501-5" add "and 505-16", and delete "Section 501.5(d)(2)".
d) 511-16(b); After 501-16 add "for Class I, Division 1 and 2 locations and Article 505-25 for Class I, Zone 0,1 and 2 locations".
3. Specific changes for 513 are:
a) 513-4; (a) Same change as 511-4 (a)
b) 513-4; (b) Change text beginning "requirements" to read "applicable provisions of Article 501 or Article 505 for the Division or Zone in which they are used".
c) 513-10; (d)(1) After "Class I, Division 2" add "or Zone 2".
d) 513-10; (e)(2) Same as 513-10 (d)(1)
e) 513-9; After "501-5" add "and Section 505-16". In second sentence delete "in Section 501-5(a)(4) and (b)(2)".
f) 513-16(b); After 501-16 add "for Class I, Division 1 and 2 locations and Article 505-25 for Class I, Zone 0,1 and 2 locations".
4. Specific changes for 514 are:
a) 514-4; After "Article 501" add "or Article 505 for the Division or Zone in which they are used".
b) 514-8; After "Division 1" add "or Zone 1" (This occurs twice). After "Division 2" add "or Zone 2". (occurs one time).
c) 514-9; Delete "be provided .... and (b)(2) shall".
d) 515-16; After 501-16 add "for Class I, Division 1 and 2 locations and Article 505-25 for Class I, Zone 0,1 and 2 locations".
5. Specific changes for 515 are:
a) 515-4; Same as 514-4
b) 515-7; After "Article 501" add "or Article 505".
c) 515-9; Delete "in Sections 501-5(a)(4) and (d)(2)" and add after "Division 1" add "or Zone 1".
d) 515-16; After 501-16 add "for Class I, Division 1 and 2 locations and Article 505-25 for Class I, Zone 0,1 and 2 locations".

SUBSTANTIATION: These changes align Articles 511-515 with the Zone system as covered in Article 505 per proposals submitted to do this. Article 516 was not included because of the mix of gas and dust hazards covered. The change to 505-13 is necessary to align the Division and Zone requirements for conductor insulation. Affected are Proposals 14-383, 14-421, 14-462, 14-478.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

COOK: Since Article 505 was included in the 1996 NEC, I am only aware of one major project that utilized the Zone concept. This was a project that was provided significant financial and engineering backing that it proved to be a significant challenge to install. To permit this to happen in the Specific Occupancies, Articles 5-11-515, <u>which will not have the financial and engineering support will be a mistake in my opinion.</u> If Proposal 14-348 is accepted and the supervision of qualified registered professional engineering is removed, we would be allowing a segment of the electrical industry that has little or no experience with the zone concept to use a method that is still quite complex. These facilities are places where our families have access on daily basis.

I also do not believe the concept has been adopted in the current editions of NFPA Standards for these occupancies.

I do not agree with the substantiation that says "for the 1996 National Electrical Code, extensive substantiation was provided to demonstrate that the zone method of classification provided equal if not higher levels of safety as compared to the division method". The substantiation that I remember from 1996 only indicated that this option was desired and needed by certain users. None of the questions raised in the Comments on Affirmative and comments on negative ballots were ever addressed by CMP-14. See comments 14-3, 14-4, 14-5, 14-6, 14-7, 14-8, 14-10, 14-12, 14-14, 14-15, 14-45, and 14-164 in the 1995 ROC.

I believe that the zone system has merit and because Article 505 was accepted through the NFPA process, I am committed to working to improve the NEC requirements. I do not support the expansion of the zone concept into the specific occupancies at this time.

COMMENT ON AFFIRMATIVE:

JAGUNICH: See ballot for David Wechsler.

(Log #3972)

14- 377 - (511): Accept in Principle

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. It is the understanding of the Technical Correlating Committee that this proposal is modified by Proposals 14-380, 14-381, 14-382, 14-383, 14-384, 14-385, 14-389, 14-390, 14-391, 14-392, 14-396, 14-397, 14-398, 14-401, 14-402, 14-406, 14-408, 14-409, 14-410, and 14-412.

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Revise the entire Article 511 as follows:

Article 511 — Commercial Garages, Repair and Storage

511.1. Scope. These occupancies shall include locations used for service and repair operations in connection with self-propelled vehicles (including, but not limited to, passenger automobiles, buses, trucks, and tractors) in which volatile flammable liquids are used for fuel or power.

511.3. Classifications of Locations.

(a) Unclassified Locations. Parking garages used for parking or storage and where no repair work is done except exchange of parts and routine maintenance requiring no use of electrical equipment, open flame, welding, or the use of volatile flammable liquids are not classified.

FPN: For further information, see NFPA 88A, Standard for Parking Structures, 1995 edition, and NFPA 88B, Standard for Repair Garages, 1997 edition.

(b) Classified Locations. Areas in which flammable fuel is transferred to vehicle fuel tanks shall conform to Article 514.

(1) Class I Location. Classification in accordance with Article 500.

(a) Up to a Level of 18 in. (457 mm) Above the Floor. For each floor, the entire area up to a level of 18 in. (457 mm) above the floor shall be considered to be a Class I, Division 2 location.

Exception: Where the enforcing agency determines that there is mechanical ventilation providing a minimum of four air changes per hour.

(b) Any Pit or Depression Below Floor Level. Any pit or depression below floor level shall be considered to be a Class I, Division 1 location, which shall extend up to said floor level.

Exception No. 1: Any pit or depression in which six air changes per hour are exhausted at the floor level of the pit shall be permitted to be judged by the enforcing agency to be a Class I, Division 2 location.

Exception No. 2: Lubrication and service rooms without dispensing shall be classified in accordance with Table 514.2.

(c) Areas Adjacent to Defined Locations or with Positive-Pressure Ventilation. Areas adjacent to defined locations in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, shall not be classified where mechanically ventilated at a rate of four or more air changes per hour or where effectively cut off by walls or partitions.

(d) Adjacent Areas by Special Permission. Adjacent areas that by reason of ventilation, air pressure differentials, or physical spacing are such that, in the opinion of the authority enforcing this Code, no ignition hazard exists, shall be unclassified.

511.4. Wiring and Equipment in Class I Locations.

(a) Wiring Located in Class I Locations. Within Class I locations as classified in Section 511.3, wiring shall conform to applicable provisions of Article 501.

(1) Raceways. Raceways embedded in a masonry wall or buried beneath a floor shall be considered to be within the Class I location above the floor if any connections or extensions lead into or through such areas.

Exception: Rigid nonmetallic conduit that complies with Article 347 shall be permitted where buried under not less than 2 ft (610 mm) of cover. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 2 ft (610 mm) of the underground run to emergency or to the point of connection to the aboveground raceway and an equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

(b) Equipment Located in Class I Locations. Within Class I locations as defined in Section 511.3, equipment shall conform to applicable provisions of Article 501.

(1) Fuel-Dispensing Units. Where fuel-dispensing units (other than liquid petroleum gas, which is prohibited) are located within buildings, the requirements of Article 514 shall govern.

Where mechanical ventilation is provided in the dispensing area, the control shall be interlocked so that the dispenser cannot operate without ventilation as prescribed in Section 500.7(b).

(2) Portable Lighting Equipment. Portable lighting equipment shall be equipped with handle, lampholder, hook, and substantial guard attached to the lampholder or handle. All exterior surfaces that might come in contact with battery terminals, wiring terminals, or other objects shall be of nonconducting material or shall be effectively protected with insulation. Lampholders shall be of an unswitched type and shall not provide means for plug-in of attachment plugs. The outer shell shall be of molded composition or other suitable material. Unless the lamp and its cord are supported or arranged in such a manner that they cannot be used in the locations classified in Section 511.3, they shall be of a type approved for Class I, Division 1 locations.

511.7 Wiring and Equipment Installed Above Class I Locations.

(a) Wiring in Spaces Above Class I Locations.

(1) Fixed Wiring Above Class I Locations. All fixed wiring above Class I locations shall be in metal raceways, rigid nonmetallic conduit, electrical nonmetallic tubing, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit or shall be Type MC, MI, manufactured wiring systems, or PLTC cable in accordance with Article 725, or Type TC cable. Cellular metal floor raceways or cellular concrete floor raceways shall be permitted to be used only for supplying ceiling outlets or extensions to the area below the floor, but such raceways shall have no connections leading into or through any Class I location above the floor.

(2) Pendant. For pendants, flexible cord suitable for the type of service and approved for hard usage shall be used.

(b) Electrical Equipment Installed Above Class I Locations.

(1) Fixed Electrical Equipment. Electrical equipment in a fixed position shall be located above the level of any defined Class I location or shall be approved for the location.

(a) Arcing Equipment. Equipment that is less than 12 ft (3.66 m) above the floor level and that may produce arcs, sparks, or particles of hot metal, such as cutouts, switches, charging panels, generators, motors, or other equipment (excluding receptacles, lamps, and lampholders) having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.

(b) Fixed Lighting. Lamps and lampholders for fixed lighting that is located over lanes through which vehicles are commonly driven or that may otherwise be exposed to physical damage shall be located not less than 12 ft (3.66 m) above floor level, unless of the totally enclosed type or constructed so as to prevent escape of sparks or hot metal particles.

(2) Attachment Plug Receptacles. Attachment plug receptacles installed in a fixed position shall be located above the level of any defined Class I location or shall be approved for the location.

511.9. Special Equipment.

(a) Battery Charging Equipment. Battery chargers and their control equipment, and batteries being charged, shall not be located within locations classified in Section 511.3.

(b) Electric Vehicle Charging Equipment.

(1) General. All electrical equipment and wiring shall be installed in accordance with Article 625, except as noted in Section 511.9(b)(2) and (3). Flexible cords shall be of a type approved for extra-hard usage.

(2) Connector Location. No connector shall be located within a Class I location as defined in Section 511.3.

(3) Plug Connections to Vehicles. Where plugs are provided for direct connection to vehicles, the point of connection shall not be within a Class I location as classified in Section 511.3, and, where the cord is suspended from overhead, it shall be arranged so that the lowest point of sag is at least 6 in. (152 mm) above the floor. Where an automatic arrangement is provided to pull both cord and plug beyond the range of physical damage, no additional connector shall be required in the cable or at the outlet.

511.10. Sealing. Approved seals conforming to the requirements of Section 501.5 shall be provided, and Section 501.5(b)(2) shall apply to horizontal as well as vertical boundaries of the defined Class I locations.

511.11. Ground-Fault Circuit-Interrupter Protection for Personnel. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used shall have ground-fault circuit-interrupter protection for personnel.

511.16. Grounded and Grounding Requirements.

(a) General Grounding Requirements. All metal raceways, the metal armor or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250.

(b) Supplying Circuits with Grounded and Grounding Conductors in Class I Locations. Grounding in Class I locations shall comply with Section 501.16.

(1) Circuits Supplying Portable Equipment or Pendants. Where a circuit supplies portables or pendants and includes a grounded conductor as provided in Article 200, receptacles, attachment plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of any lampholder or to the grounded terminal of any utilization equipment supplied.

(2) Approved Means. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the noncurrent-carrying metal portions of pendant fixtures, portable lamps, and portable utilization equipment.

SUBSTANTIATION: 1. All Section numbering has been changed to decimal or point system to conform to the NEC Style Manual.

2. Deleted Section 511-2 and incorporated the text into 511.3 in a new (a) for unclassified locations and (b) for classified locations.

3. Title have been added to major subsections to provide clarity and comply with the NEC Style Manual.

4. Old Section 511-3(b), fourth line to the seventh line starting with the word “except” has been reformatted into a new Exception No. 1 and the existing exception has been relabeled as Exception No. 2. Exceptions to the general rule should not be located in

positive text. It is more recognizable as an exception and easier for the user to identify it as an exception.

5. Old Sections 511-3(e) and (f) dealing with dispensers and portable lighting equipment has been relocated into subsections 511.4(b)(1) and (2) since they are really dealing with equipment in a classified location.

6. Old Section 511-4 has been divided into two new subsections. Section 511.4(a) deals with wiring in Class I locations and Section 511.4(b) deals with electrical equipment located in a Class I location.

7. The word "defined" has been change in old Sections 511-4 and 511-9(b) to "classified" since Section 511.3 does not define the classified locations; that is done Section 500-7. Section 511.3 provides area classifications for various locations. This also provides consistency for the text throughout the Article. See Old Sections 511-3(f) and 511-8.

8. Old Section 511-5 has been changed to 511.6 and 511-6 has been changed to 511.7 to provide consistency between the article dealing with specific hazardous location occupancies.

9. Section 511.9 has been relabeled as Special Equipment. Old Section 511-8 covering battery charging equipment has been relocated into Section 511.9(a) and old Section 511-9 for electric vehicle charging equipment has been relocated as Section 511.9(b).

10. Section 511.16 was relabeled with a new (a) and (b). New subsection (a) provides general requirements for grounding in Class I locations. New subsection 511.16(b) deals with the text that was located in former Section 511-6(c). The text that was in Section 511-6(c) is really dealing with grounded and grounding conductors and should be located within the Section dealing with grounding.

PANEL ACTION: Accept in Principle.

Accept the proposal as presented, but renumber 511-9 to 511-10; renumber 511-10 to 511-9; renumber 511-11 to 511-12

PANEL STATEMENT: The minor changes implement a standardized numbering format for Articles 511 through 516.

(Log #3993)

14- 378 - (511): Accept in Principle

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Revise the entire Article 511 as follows:

Article 511 — Commercial Garages, Repair and Storage

511.1. Scope. These occupancies shall include locations used for service and repair operations in connection with self-propelled vehicles (including, but not limited to, passenger automobiles, buses, trucks, and tractors) in which volatile flammable liquids are used for fuel or power.

511.3. Locations. Areas in which flammable fuel is transferred to vehicle fuel tanks shall conform to Article 514. Parking garages used for parking or storage and where no repair work is done except exchange of parts and routine maintenance requiring no use of electrical equipment, open flame, welding, or the use of volatile flammable liquids are not classified.

FPN: For further information, see NFPA 88A, Standard for Parking Structures, 1995 edition and NFPA 88B, Standard for Repair Garages, 1997 edition.

Where fuel-dispensing units (other than liquid petroleum gas, which is prohibited) are located within buildings, the requirements of Article 514 shall govern.

Where mechanical ventilation is provided in the dispensing area, the controls shall be interlocked so that the dispenser cannot operate without ventilation as prescribed in Section 500.7(b).

(a) Class I Locations. Classification under Article 500.

(1) Up to a Level of 18 in. (457 mm) Above the Floor. For each floor, the entire area up to a level of 18 in. (457 mm) above the floor shall be considered to be a Class I, Division 2 location.

Exception: Where the enforcing agency determines that there is mechanical ventilation providing a minimum of four air changes per hour.

(2) Any Pit or Depression Below Floor Level. Any pit or depression below floor level shall be considered to be a Class I, Division 1 location, which shall extend up to said floor level, except that any pit or depression in which six air changes per hour are exhausted at the floor level of the pit shall be permitted to be judged by the enforcing agency to be a Class I, Division 2 location.

Exception: Lubrication and service rooms without dispensing shall be classified in accordance with Table 514.2.

(b) Unclassified Locations.

(1) Areas Adjacent to Defined Locations or with Positive-Pressure Ventilation. Areas adjacent to defined locations in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, shall not be classified where mechanically ventilated at a rate of four or more air changes per hour or where effectively cut off by walls or partitions.

(2) Adjacent Areas by Special Permission. Adjacent areas that by reason of ventilation, air pressure differentials, or physical spacing are such that, in the opinion of the authority enforcing this Code, no ignition hazard exists, shall be unclassified.

511.4. Wiring and Equipment in Class I Locations.

(a) Wiring. Within Class I locations as defined in Section 511.3, wiring and equipment shall conform to applicable provisions of Article 501.

(b) Equipment.

Portable Lighting Equipment. Portable lighting equipment shall be equipped with handle, lampholder, hook, and substantial guard attached to the lampholder or handle. All exterior surfaces that might come in contact with battery terminals, wiring terminals, or other objects shall be of nonconducting material or shall be effectively protected with insulation. Lampholders shall be of an unswitched type and shall not provide means for plug-in of attachment plugs. The outer shell shall be of molded composition or other suitable material. Unless the lamp and its cord are supported or arranged in such a manner that they cannot be used in the locations classified in Section 511.3, they shall be of a type approved for Class I, Division 1 locations.

511.5. Wiring and Equipment Embedded, Underslab, or Underground. Raceways embedded in a masonry wall or buried beneath a floor shall be considered to be within the Class I location above the floor if any connections or extensions lead into or through such areas.

Exception: Rigid nonmetallic conduit that complies with Article 347 shall be permitted where buried under less than 2 ft (610 mm) of cover. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 2 ft (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway and an equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

511.6. Sealing. Approved seals conforming to the requirements of Section 501.5 shall be provided, and Section 501.5(b)(2) shall apply to horizontal as well as vertical boundaries of the defined Class I locations.

511.7 Wiring and Equipment Not Within Class I Locations.

(a) Fixed Wiring Above Class I Locations. All fixed wiring above Class I locations shall be in metal raceways, rigid nonmetallic conduit, electrical nonmetallic tubing, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit or shall be Type MC, MI, manufactured wiring systems, or PLTC cable in accordance with Article 725, or Type TC cable. Cellular metal floor raceways or cellular concrete floor raceways shall be permitted to be used only for supplying ceiling outlets or extensions to the area below the floor, but such raceways shall have no connections leading into or through any Class I location above the floor.

(b) Pendants. For pendants, flexible cord suitable for the type of service and approved for hard usage shall be used.

(c) Grounded and Grounding Conductors. Where a circuit supplies portables or pendants and includes a grounded conductor as provided in Article 200, receptacles, attachment plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of any lampholder or to the grounded terminal of any utilization equipment supplied. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the noncurrent-carrying metal portions of pendant fixtures, portable lamps, and portable utilization equipment.

(d) Attachment Plug Receptacles. Attachment plug receptacles in a fixed position shall be located above the level of any defined Class I location or shall be approved for the location.

(e) Arcing Equipment. Equipment that is less than 12 ft (3.66 m) above the floor level and that may produce arcs, sparks, or particles of hot metal, such as cutouts, switches, charging panels,

generators, motors, or other equipment (excluding receptacles, lamps, and lampholders) having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.

(f) Fixed Lighting. Lamps and lampholders for fixed lighting that is located over lanes through which vehicles are commonly driven or that may otherwise be exposed to physical damage shall be located not less than 12 ft (3.66 m) above floor level, unless of the totally enclosed type of construction so as to prevent escape of sparks or hot metal particles.

511.8 Special Equipment.

(a) Battery Charging Equipment. Battery chargers and their control equipment, and batteries being charged, shall not be located within locations classified in Section 511.3.

(b) Electric Vehicle Charging.

(1) General. All electrical equipment and wiring shall be installed in accordance with Article 625, except as noted in Section 511.9(b) and (c). Flexible cords shall be of a type approved for extra-hard usage.

(2) Connector Location. No connector shall be located within a Class I location as defined in Section 511-3.

(3) Plug Connections to Vehicles. Where plugs are provided for direct connection to vehicles, the point of connection shall not be within a Class I location as defined in Section 511.3, and, where the cord is suspended for overhead, it shall be arranged so that the lowest point of sag is at least 6 in. (152 mm) above the floor. Where an automatic arrangement is provided to pull both cord and plug beyond the range of physical damage, no additional connector shall be required in the cable or at the outlet.

(c) Ground-Fault Circuit-Interrupter Protection for Personnel. All 125-volt, single-phase, 15- and 20-ampere receptacles installed in areas where electrical diagnostic equipment, electrical hand tools, or portable lighting equipment are to be used shall have ground-fault circuit-interrupter protection for personnel.

511.6. Grounding. All metal raceways, the metal armors or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded a provided in Article 250. Grounding in Class I locations shall comply with Section 501.16.

SUBSTANTIATION: This proposal is the work of a Task Group including Donny Cook, Fred Walker, Gordon Johnson, Don Zipsi, Mark Goodman, Kevin Earley, Mark Ode, Bob Benedetti, and Richard Hild. The Task Group was not balloted. The purpose of the proposal is to provide parallel numbering from Article 511 through 516 to comply with Section 2.4.1 of the NEC Style Manual.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: See Proposal 14-377.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

COMMENT ON AFFIRMATIVE:

WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #2394)

14- 379 - (511-1): Reject

SUBMITTER: William E. Bickner, Stillwater, MN

RECOMMENDATION: Revise as shown below:

511-1. Scope. These occupancies shall include locations for service and repair operations in connection with self-propelled vehicles (including, but not limited to, passenger automobiles, buses, trucks, ~~and~~ tractors, motorcycles, all-terain vehicles, snowmobiles, lawn and garden equipment, and boats) in which volatile flammable liquids are used for fuel or power.

SUBSTANTIATION: CMP 14 has rejected similar past proposals with panel statements such as "Article 511 is based on the requirements of NFPA 88A and 88B, which do not mention motor boats. CMP 14 has no jurisdiction over the definition of self-propelled vehicles, and does not agree" (1992 TCR, proposal 14-186). In fact, NFPA 88B also does not refer to "passenger automobiles," "tractors," "buses," or "self-propelled vehicles," as does NEC Section 511-1. In defining a repair garage, NFPA 88B refers to "motorized vehicles or automobiles." A "motorized vehicle," in the broadest sense, as defined in dictionaries, is "a means, equipped with a motor, of carrying or transporting something," and rationally includes the types of vehicles proposed to be added. It appears that the committee used its own terms in writing the scope statement, and would therefore be free to modify the scope to suit the needs of the NEC user. The panel may be correct in not including other equipment, but whatever its determination, there is a need to clarify the intent of this section, which is variously interpreted in the field. Although, as the committee has suggested, Section 500-5 may be used to determine the classification of areas where such equipment is serviced or repaired (1992 TCR, proposal 14-184), that is also true of the types of vehicles presently listed in 511-1, and is obviously impractical, as evidenced by the existence Article 511. If it is not the panel's intent to include such vehicles, a clear statement to that effect would be useful.

PANEL ACTION: Reject.

PANEL STATEMENT: NFPA 88B is limited to automotive vehicles and boats are covered by Article 555 and the panel believes there is no need for the list of vehicles covered by Article 511 to be all-inclusive.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #2395)

14- 380 - (511-1): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: William E. Bickner, Stillwater, MN

RECOMMENDATION: Revise as shown below:

511-1. Scope. These occupancies shall include locations used for service and repair operations in connection with self-propelled vehicles (including, but not limited to, passenger automobiles, buses trucks, and tractors) in which volatile flammable liquids or flammable gases are used for fuel or power.

SUBSTANTIATION: Vehicles using fuels such as liquified petroleum gas or compressed natural gas should be included in this article, as they are not specifically covered elswhere in the Code. The reference to LPG in NEC Section 511-3(e) and CNG in Section 3-1.1 of NFPA 88B indicates an intent to cover vehicles using those fuels. NFPA 88B, Section 3-1.1 requires an additional 18 in classified location at the ceiling of repair garages for vehicles using CNG, which is not addressed in NEC Article 511 or other NEC Articles. A separate proposal has been submitted to add that requirement to Section 511-3(a).

PANEL ACTION: Accept.

PANEL STATEMENT: Panel 14 recognizes that the scope is the jurisdiction of the Correlating Committee and recommends acceptance of this change.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #2396)

14- 381 - (511-2): Accept in Principle in Part

SUBMITTER: William E. Bickner, Stillwater, MN

RECOMMENDATION: Revise Section 511-2 according to the following:

511-2. Locations. Areas in which flammable fuel is transferred to vehicle fuel tanks shall conform to Article 514 and the applicable provisions of Articles 511 and 501. Buildings or portions of buildings without dispensing which are used for lubrication, inspection, and minor maintenance work, such as tune-ups and brake system repairs, but not for major repairs, painting, or body work, shall be classified in accordance with Table 514-2 and shall conform to the applicable provisions of Articles 511 and 501.

(balance of paragraph unchanged)

Delete the exception to 511-3(b) in its entirity.

SUBSTANTIATION: In its present location, the exception to Section 511-3(b) appears to apply only to (b), a pit or "depression below floor level," but is presumably intended to apply to lubrication and service areas in general. The proposed change corrects this by changing the exception to an independent statement and relocating it to Section 511-2 to be grouped with the other statements regarding the applicability of Articles 511 and 514. Some Code users may miss the point that this exception applies to classification only, so the proposed change also clarifies that wiring and equipment must conform to Articles 501 and 511. The term "service room" is undefined, making the applicability of the exception unclear. The added material clarifies this, using

language from the definition of the term "automotive service station" in NFPA 88B.
A separate proposal has been submitted to delete the exception to Section 511-3(b).
PANEL ACTION: Accept in Principle in Part.
Add the word "also" after the word "shall" in the first sentence of existing 511-2.
PANEL STATEMENT: The changes indicate that 511 applies also, not just 514. The exception, however, must be retained to indicate that only below-grade areas are being addressed.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #310)

14- 382 - (511-2 and FPN): Accept
SUBMITTER: Technical Committee on Automotive and Marine Service Stations
RECOMMENDATION: Add a new second paragraph and a new fine print note to read as follows:
"The storage, handling, or dispensing into motor vehicles of alcohol-based windshield washer fluid in areas used for the service and repair operations of the vehicles shall not cause such areas to be classified as hazardous (classified) locations.
(FPN): For further information, see NFPA 30A, Automotive and Marine Service Station Code, Subsection 7-3.5."
SUBSTANTIATION: The purpose of this proposal is to correlate NFPA 30A and the NEC. The delineation and classification of areas for the purpose of installing electrical wiring and electrical utilization equipment in automotive service stations, automotive repair facilities, and similar occupancies is the responsibility of the Technical Committee on Automotive and Marine Service Stations. During the code cycle for the 1996 edition of NFPA 30A, the Technical Committee reviewed a report "Fire Safety and Health Evaluation of Methanol in an Instant Oil-Change Store" (10/24/94, Ashland Chemical Company, Analytical Services and Technology, Environmental Analysis Laboratory). Based on the technical analysis and information in this report, the fire data gathered by NFPA's Fire Analysis and Research Dept., and the requirements of NFPA 30A, Subsections 2-3.1 and 2-3.2, the Technical Committee added subsection 7-3.5 to Chapter 7, Electrical Equipment, to the 1996 edition of NFPA 30A. By incorporating the proposed new text into Section 511-2 of NFPA 70, potential misunderstandings and conflicts between fire officials and electrical inspectors can be avoided.
The Technical Committee reviewed Article 514 of NFPA 70 and felt that, since 514-1, second paragraph requires "... lubritoriums, service rooms,... and similar occupancies shall comply with Articles 510 and 511 with respect to electrical wiring and equipment...", it is recommending that the most appropriate place to correlate this requirement with NFPA 30A is Section 511-2. If Panel 14 determines that another location(s) or alternate wording to meet the writing style of the National Electrical Code is needed, the Technical Committee on Automotive and Marine Service Stations would have no issue with such Panel actions, since correlation of the two codes is our only concern.
PANEL ACTION: Accept.

(Log #3024)

14- 383 - (511-3): Accept
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Revise text as follows:
Classification under Article 500 or 505.
(a) Up to a Level of 18 in. (457 mm) Above the Floor. For each floor, the entire area up to a level of 18 in. (457 mm) above the floor shall be considered to be a Class I, Division 2, or Zone 2 location.
Exception: Where the enforcing agency determines that there is mechanical ventilation providing a minimum of four air changes per hour.
(b) Any Pit or Depression Below Floor Level. Any pit or depression below floor level shall be considered to be a Class I, Division 1 or Zone 1 location, which shall extend up to said floor level, except that any pit or depression in which six air changes per hour are exhausted at the floor level of the pit shall be permitted to be judged by the enforcing agency to be a Class I, Division 2 or Zone 2 location.
SUBSTANTIATION: This proposal is to recognize the alternate method for classification that was introduced into the 1996 National Electrical Code.
PANEL ACTION: Accept.

EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative Vote on Proposal 14-376a.

(Log #2397)

14- 384 - (511-3(a)): Accept in Principle
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Add the following between the existing text and the exception:
"Where compressed natural gas (CNG) vehicles are repaired or stored, the area within 18 in of the ceiling shall be classified as Class I, Division 2."
SUBSTANTIATION: The proposed addition is taken directly from Section 3-1.1 of NFPA 88B, and should be included in this article to address this potential problem and to be consistent with that standard.
PANEL ACTION: Accept in Principle.
Add a new paragraph to 511-3 as follows:
"(b)x Within 18" of the Ceiling. Where compressed natural gas (CNG) vehicles are repaired or stored, the area within 18 in of the ceiling shall be classified as Class I, Division 2, except where ventilation of at least 4 air changes per hour is provided."
Renumber as appropriate.
PANEL STATEMENT: The panel's version is extracted directly from NFPA 88B.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #4355)

14- 385 - (511-3(a)): Accept in Principle
SUBMITTER: Marty Kumm, Board of Electricity, State of Minnesota
RECOMMENDATION: Revise text to read as follows:
(a) Up to a Level of 18 in. (457 mm) Above the Floor. For each floor, the entire area up to a level of 18 in. (457 mm) above the floor shall be considered to be a Class I, Division 2 location.
Exception: Where the enforcing agency determines that there is mechanical ventilation providing a minimum of four air changes per hour or one cubic foot per minute of exchanged air for each square foot of floor area with the exhaust air being taken within 18 in. of the floor.
SUBSTANTIATION: The hazard in this type of occupancy is more closely related to the floor area and the number of vehicle or hazardous material that may be parked or located in such occupancies. By relaying only on 4 air changes per hour, the occupancies with high ceilings are being penalized. These occupancies have to provide a very large ventilation system when the hazard present is not any greater, because the basic square footage is the same. Using the square footage as a basis for the ventilation would allow these high ceiling buildings an option that might save some cost and provide for the same level of safety. This would provide 4 air changes per hour for a building with a ceiling up to 15 ft high. This would also help bring the National Electrical Code into sync with other model building codes within the U.S.
PANEL ACTION: Accept in Principle.
Change the wording of the existing exception to read:
"Exception: Where the enforcing agency determines that there is mechanical ventilation providing a minimum of four air changes per hour or one cubic foot per minute of exchanged air for each square foot of floor area. Ventilation shall provide for air exchange across the entire floor area within 12 in (0.3m) of the floor."
PANEL STATEMENT: The panel's version provides more flexibility and ensures that the area in question has sufficient

ventilation. The change from 18 in to 12 in is consistent with Table 514-2.

(Log #2340)

14- 386 - (511-3(a) Exception No. 2 (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add the following Exception:
Exception No 2: Lubrication and service rooms without dispensing.
SUBSTANTIATION: This new exception will hopefully clarify that lubrication and service rooms without dispensing are not classified locations. Support for this can be found in NEC 511-3(b) Exception No. 1. A pit in these locations is a Class I Division II area per Table 514-2. If in fact this is true the area above the pit should not be classified (except as required by the aforementioned table).
If the area above the pit is in fact a Class I Division II location, the pit should be a Class I Division I location to remain consistent with other code sections relating to pits. This would then require a change to 517-3(b) exception to state that it would be a Class I Division II location with the proper ventilation.
Presently it appears that both the pit and work floor area in this type of occupancy are Class I Division II areas.
PANEL ACTION: Reject.
PANEL STATEMENT: This new exception is not warranted. Existing requirements apply.

(Log #4305)

14- 388 - (511-3(c)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise as shown below:
(c) Areas Adjacent to Defined Locations or with Positive-Pressure Ventilation. Areas adjacent to defined locations in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, shall not be classified where (1) mechanically ventilated at a rate of four or more air changes per hour, ~~or where~~ (2) effectively cut off by walls or partitions, (3) the floors of the areas are elevated not less than 18 in. above the adjacent garage floor, or (4) the floors of the areas are separated from the adjacent garage floor by tight curbs or partitions not less than 18 in. high .
SUBSTANTIATION: Article 510 of the 1953 and 1956 NEC and 511 of the 1959 through 1971 NEC contained the following provision concerning commercial garages: "Adjacent areas in which flammable vapors are not likely to be released, such as stock rooms, switchboard rooms, and other similar locations, having floors elevated at least 18 inches above adjacent garage floor, or separated therefrom by tight curbs or partitions at least 18 inches high, shall not be classed as hazardous." The present provisions of Section 511-3(c) were part of the rewrite of Article 511 proposed by NECA (1974 NEC "Preprint", Proposal No. 38 to CMP 14.), which was adopted verbatim.
The relevant part of the substantiation for this proposal stated: "This means that the entire area, whether single or multi-storied, be treated as hazardous up to at least 18 inches above the floor. Going further with the code wording , it is necessary to build curbs 18 inches high at the entrance to each elevator or escalator in a storage garage. The inspectors recognized how ridiculous this requirement was and did not enforce it."
The change had the desired effect of allowing adjacent locations to be unclassified without differences in floor elevations or curbs or concurrence of the authority having jurisdiction as provided under the 1968 and later editions of the Code. However, it eliminated the 18 inch height differential or curb as a permitted means of separation. This omission was apparently unintentional, since the intent was to relax this requirement, not disallow it. This reasonable, time-tested practice was permitted by the Code for more than 20 years, is still permitted by some authorities having jurisdiction, and should be reinstated to allow more flexibility in wiring such locations.
PANEL ACTION: Reject.
PANEL STATEMENT: Requierements in previous editions of the NEC back to 1953 are not justification for this change. The submitter's proposals are already permitted by the code.

(Log #38)

14- 391 - (511-3(g), 511-1, and Appendix A (New)): Accept in Principle

NOTE: The following proposal consists of Comment 14-107 on Proposal N/A in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE.

SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc./Rep. Convenient Automotive Services Inst. (CASI)

RECOMMENDATION: New text for correlation between NFPA 30A and the NEC.

Add new Section 511-3(g) to read as follows:

(g) Methyl Alcohol-Based Windshield Washer Fluid* Where alcohol-based windshield washer fluids are stored, handled, or dispensed into motor vehicles, electrical wiring and electrical equipment shall be designed and installed for general purpose (nonclassified) locations.

Add new paragraph to 514-1:

*Where alcohol-based windshield washer fluids are stored, handled, or dispensed into motor vehicles, electrical wiring and electrical equipment shall be designed and installed for general purpose (nonclassified) locations.

Add to Appendix A - Extracts:

511-3(g) Automotive and Marine Service Station Code, NFPA 30A-1996, Section 7-3.5.

514-1 Automotive and Marine Service Station Code, NFPA 30A-1996, Section 7-3.5.

SUBSTANTIATION: In the past NFPA staff would correlate extracted material between NFPA 30A and the NEC. In my review of the ROP for the proposed 1999 NEC, I realized that the correlation of the change in the 1996 edition of NFPA 30A (effective dated 8/9/96) was not passed on to the Panel 14 to incorporate into the 1999 edition of the NEC. Without this correlation between the two Codes, electrical inspectors will not have the revised requirements to NFPA 30A, Table 7, which is the basis of the NEC Table 514-2. By incorporating the new electrical classification of NFPA 30A, Section 7-3.5, into the NEC, potential misunderstanding and conflicts between fire and electrical inspectors can be avoided

PANEL ACTION: Accept in Principle.

NOT RETURNED: 2 Earley, Saban

(Log #2399)

14- 393 - (511-4): Reject

SUBMITTER: William E. Bickner, Stillwater, MN

RECOMMENDATION: Modify the last sentence before the exception as follows:

"Raceways embedded in a masonry wall or buried beneath a floor shall be considered to be within the Class I location above the floor if any connections or extensions lead into or through such areas and have any union, coupling, box, or fitting within, or within 12 in of a boundary of, the Class I location."

SUBSTANTIATION: This proposal would make this requirement consistent with Exception No. 1 to Section 501-5(b)(2), which permits seals to be deleted under the same conditions as those of the proposal, presumably because significant amounts of flammable gases cannot enter such conduits. Rigid or intermediate metal conduit are the only raceways permitted for such installations in view of Section 501-4(b), which would result in an equivalent condition.

PANEL ACTION: Reject.
PANEL STATEMENT: Article 501 already applies.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #3977)

14- 394 - (511-4): Reject

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Revise text to read as follows:

511-4. Wiring and Equipment in Class I Locations. Within Class I locations as defined in Section 511-3, wiring and equipment shall conform to applicable provisions of Article 501. Raceways embedded in a masonry wall or buried beneath a floor shall be ~~considered to be within the Class I location above the floor if any connections or extensions lead into or through such areas.~~ sealed with a listed seal when it emerges from below grade or from being embedded in a masonry wall.

SUBSTANTIATION: To provide common wording for conduit systems installed below grade from Articles 511 through 516.

PANEL ACTION: Reject.
PANEL STATEMENT: The requirements of Article 501 already apply and a seal may not be required in every case.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: The purpose for the proposal was to provide common wording for underground or in slab wiring and associated seals in the specific occupancies. The submitter assumed that the restrictions for this wiring are based on hazardous materials entering the raceways and trying to prevent the migration of the liquids, gases or vapors to an ignition source at the end of the raceway. See Panel Statement on Proposal 14-428. It seems that the hazardous materials associated with at least Articles 511-515 are very similar and that preventing this migration could be done with

common wording. Since different words are used in each Article, the code language leads users to believe that gas entering a raceway under a commercial garage will react differently than gas entering a raceway under a drive at a dispensing station. I do not believe this is true and believe that common language could be used. Based on the various words shown below, and questions that are asked over and over, I believe the existing wording causes confusion and should be changed. If this set of words is a problem, some technical reason should be provided for rejecting the proposal, so that acceptable wording could be proposed.

Underground Wiring & Sealing Requirements in 1999 NEC read:

511-4 Wiring and Equipment in Class I Locations. Within Class I locations as defined in Section 511-3, wiring and equipment shall conform to applicable provisions of Article 501. Raceways embedded in a masonry wall or buried beneath a floor shall be considered to be within the Class I location above the floor if any connections or extensions lead into or through such areas.

511-5 Sealing. Approved seals conforming to the requirements of Section 501-5 shall be provided and Section 501-5(b)(2) shall apply to horizontal as well as vertical boundaries of the defined Class I locations.

513-4 Wiring and Equipment in Class I Locations. All wiring and equipment that is or may be installed or operated within any of the Class I locations defined in Section 513-3 shall comply with the applicable provisions of Article 501. All wiring installed in or under the hangar floor shall comply with the requirements for Class I, Division 1 locations.

513-8 Sealing. Approved seals shall be provided in accordance with Section 501-5. Sealing requirements specified in Sections 501-5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Raceways embedded in a concrete floor or buried beneath a floor shall be considered to be within the Class I location above the floor.

514-8 Underground Wiring. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit. Any portion of electrical wiring or equipment that is below the surface of a Class I, Division 1 or Division 2 location (as defined in Table 514-2) shall be considered to be in a Class I , Division 1 location, which shall extend at least to the point of emergence above grade. Refer to Table 300-5.

514-7 Sealing

(a) At Dispenser. An approved seal shall be provided in each conduit run entering or leaving a dispenser or any cavities or enclosures in direct communication therewith. The sealing fitting shall be the first fitting after the conduit emerges from the earth or concrete.

(b) At Boundary. Additional seals shall be provided in accordance with Section 501-5. Sections 501-5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations.

515-5 Underground Wiring

(a) Wiring Method. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit or, where buried under not less than 2 ft (610 mm) of cover, shall be permitted in rigid nonmetallic conduit or an approved cable. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 2 ft (610 mm) of the conduit run to emergence or to the point of connection to the aboveground raceway. Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal conduit from the point of lowest buried cable level to the point of connection to the aboveground raceway.

515-6 Sealing. Sealing requirements in Sections 501-5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Buried raceways under defined Class I locations shall be considered to be within a Class I, Division 1 location.

516-7 Wiring and Equipment Above Class I and II Locations

(a) Wiring. All fixed wiring above the Class I and II locations shall be in metal raceways, rigid nonmetallic conduit, or electrical nonmetallic tubing, or shall be Type MI, TC, or MC cable. Cellular metal floor raceways shall be permitted only for supplying ceiling outlets or extensions to the area below the floor of a Class I or II location, but such raceways shall have no connections leading into or through the Class I or II location above the floor unless suitable seals are provided.

(Log #2131)

14- 395 - (511-4(a) Exceptions No. 2 and No. 3): Accept in Principle

Note: The Technical Correlating Committee understands that the reference in the Panel Statement should be to Proposal 14-59a.

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Revise to read as follows:

Exception No. 2: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type MC cable, listed for use in Class I, Division 1 locations with a gas/vaportight continuous corrugated aluminum sheath, an overall jacket of suitable polymeric material, separate grounding conductors, Type MC-HL, in accordance with Section 250-122, and provided with termination fittings listed for the application shall be permitted.

FPN: See Sections 334-3 and 334-4 for restrictions on use of Type MC cable.

Exception No. 3: In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons will service the installation, Type ITC cable, listed for use in Class I, Division 1 locations, with a gas/vaportight continuous corrugated aluminum sheath, an overall jacket of suitable polymeric materials, Type ITC-HL, and provided with termination fittings listed for the application shall be permitted.

SUBSTANTIATION: Cable that complies with the requirements of this exception and listed in accordance with UL Standard 2225, is marked with the prefix "-HL". Since this is the required marking of the cable to describe the requirements, the marking should be shown in this section. It is also suggested that the detailed cable requirements in this exception may be dropped after one or two additional code cycles, after users are familiar with the cable marking requirements.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The panel believes this proposal applies to Article 501, not 511, and is being addressed by Proposal 14-318a.

(Log #3025)

14- 398 - (511-6): Accept
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Revise text as follows:
511-6. Wiring in Spaces Above Class I Locations.
(a) Fixed Wiring Above Class I Locations. All fixed wiring above Class I locations shall be in metal raceways, rigid nonmetallic conduit, electrical nonmetallic tubing, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit or shall be Type MC, MI, manufactured wiring systems, or PLTC cable in accordance with Article 725, or Type TC cable, or Type ITC cable in accordance with Article 727. Cellular metal floor raceways or cellular concrete floor raceways shall be permitted to be used only for supplying ceiling outlets or extensions to the area below the floor, but such raceways shall have no connections leading into or through any Class I location above the floor.
SUBSTANTIATION: This proposal adds type ITC to the list of various cable types and wiring methods suitable for use in spaces above Class I locations.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #2400)

14- 399 - (511-6(a)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Delete terms and correct construction as shown:
(a) Fixed Wiring Above Class I Locations. All fixed wiring above Class I locations shall be in metal raceways, rigid nonmetallic conduit, electrical nonmetallic tubing, ~~flexible metal conduit, liquidtight flexible metal conduit,~~ or liquidtight flexible nonmetallic conduit or shall be Type MC, MI, or TC cable, PLTC cable in accordance with Article 725, or manufactured wiring systems~~, or PLTC cable in accordance with Article 725 or Type TC cable~~. (balance unchanged)
SUBSTANTIATION: The wiring methods proposed to be deleted are all defined as raceways in Article 100. If it was intended to list the types of metal raceways, which seems unnecessary as they are all permitted by inclusion of the term "metal raceways" in this section, the list should also include rigid metal conduit, intermediate metal conduit, flexible metallic tubing, electrical metallic tubing, underfloor raceways, cellular metal floor raceways, surface metal raceways, metal wireways, and busways.
The references to cable wiring methods are rearranged to provide a more coherent sentence.
PANEL ACTION: Reject.
PANEL STATEMENT: The current text correctly expresses the intent of Code Making Panel 14.

NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I agree with submitter's proposal and substantiation.

(Log #2401)

14- 400 - (511-6(a)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Delete text and correct construction as shown below:
(a) Fixed Wiring Above Class I Locations. All fixed wiring above Class I locations shall be in ~~metal~~ raceways, ~~rigid nonmetallic conduit, electrical nonmetallic tubing, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit~~ or shall be Type MC, MI, or TC cable, PLTC cable in accordance with Article 725, or manufactured wiring systems~~, or PLTC cable in accordance with Article 725 or Type TC cable~~. (balance unchanged)
SUBSTANTIATION: The specific metallic wiring methods proposed to be deleted are defined as raceways in Article 100. If it was intended to list the types of metal raceways, which seems unnecessary as they are all permitted by inclusion of the term "metal raceways" in this section, the list should also include rigid metal conduit, intermediate metal conduit, flexible metallic tubing, electrical metallic tubing, underfloor raceways, cellular metal floor raceways, surface metal raceways, metal wireways, and busways.
The only types of raceways defined as such but not expressly permitted under the present wording, are surface nonmetallic raceways, and nonmetallic wireways. Cellular metal floor raceways and cellular concrete floor raceways are, and would continue to be, permitted under the same limited conditions. Because electrical nonmetallic tubing is permitted, it would seem reasonable permit surface nonmetallic raceways and wireways, which arguably provide protection at least as effective as ENT or the permitted types of cable. (Note that surface nonmetallic raceways are not permitted where subject to severe physical damage and surface nonmetallic wireways and electrical nonmetallic tubing are not permitted where subject to physical damage under their respective articles.)
The references to cable wiring methods are rearranged to provide a more coherent sentence.
PANEL ACTION: Reject.
PANEL STATEMENT: The current text correctly expresses the intent of Code Making Panel 14.

(Log #1640)

14- 401 - (511-6(b)): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise first sentence to read as follows:
(b) Pendants. For pendants, flexible cord suitable for the type of service and ~~approved~~ (identified) for hard usage shall be used.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
Change "approved" to "listed".
PANEL STATEMENT: Listed extra-hard and hard usage cord is readily available.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

NOT RETURNED: 2 Earley, Saban

(Log #1891)

14- 412 - (511-9(c)): Accept in Part
SUBMITTER: Frank J. Cihak, American Public Transit Assoc./Rep. Nat'l Electric Transportation Infrastructure Working Council
RECOMMENDATION: Revise to read as follows:
(c) Electric Vehicle Supply Equipment Cable Management. ~~Plug Connection to Vehicles. Where plugs are provided for direct connection to vehicles, the point of connection shall not be within a Class I location as defined in Section 511-3, and, w~~ Where the cord is suspended from overhead, it shall be arranged so that the lowest point of sag is at least 6 in. (152 mm) above the floor. Where an automatic arrangement is provided to pull both the cord and plug beyond the range of physical damage, no additional connector shall be required in the cable or at the outlet.
SUBSTANTIATION: The new title addresses in more generic terms the intent of this article. The first phrase was moved to 511-9(b) for editorial clarity. The portion of the article addressing location has been combined with Section 511-9(b). The modified terminology in (b) and (c) is consistent with Article 625, Electric Vehicle Charging Systems.
PANEL ACTION: Accept in Part.
Delete the first sentence only.
PANEL STATEMENT: Panel 14 agrees that the first sentence is redundant, but believes that the existing title is correct.

NOT RETURNED: 2 Earley, Saban

(Log #1795)

14- 413 - (511-10, Exception): Reject
SUBMITTER: Noel Williams, Noel Williams Consulting
RECOMMENDATION: Add Exception as follows:
"A single receptacle or duplex receptacle for two appliances located within dedicated space for each appliance that, in normal use, is not easily moved from one place to another, and that is cord-and plug -connected in accordance with Section 400-7(a)(6), (a)(7), or (a)(8) shall not be required to be GFCI protected."
SUBSTANTIATION: The present requirement applies to areas without regard to actual use. Some appliances that may be used in garages are not appropriate for use with GFCIs. The proposed language is borrowed from the exceptions to Sections 210-8 (a)(2) and (a)(5), and the reasoning is identical to that provided for these exceptions.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "appliance" is too broad and the panel believes the safety risk is not acceptable.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #2339)

14- 414 - (511-11 (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new section as follows:
511-11. Welding. Welding shall not be permitted in any classified area unless one of the following are provided.
1. Continuous exhaust ventilation at the rate of 4 air changes per hour is provided and the welding equipment is interlocked in such a way as to not permit the operation of the unit should the ventilation not be operational. OR 2. An exhaust ventilation system that provides a minimum of 4 air changes per hour that is interlocked with the welder in such a way as to not allow the welder to operate unless the ventilation system has been in operation for not less than 15 minutes prior to welding and, that will not permit the welding equipment to operate if the ventilation system is not operable. OR 3. The facility has no exterior walls on at least 3 sides for natural ventilation.
SUBSTANTIATION: It is believed by many that welding is permitted in a repair garage under any circumstance. This is due to model building codes classifying the occupancy as acceptable for welding or open flame and requiring a minimum amount of ventilation. (The ventilation required by the other codes, whether they are mechanical, building or fire, is for fresh air for human occupants.) What is confusing about this is that welding or cutting produces thousands of particles of hot molten metal that may radiate for up to a 35 ft radius from the point of work (the measurement given is from NFPA 51B), and NEC 511-7 will not permit arching or sparking equipment within 12 feet of floor level. This is to say the least, perplexing. How can we as owners, designers, installers, and enforcement professionals legitimately permit a welder in this occupancy when we would not permit a light switch or receptacle in the classified area?
Further in NFPA 51B Standard for Fire Prevention in use of Cutting and Welding, section 3-1.1 will not permit cutting or welding in the presence of explosive atmospheres. NFPA 51B in chapters 2 and 3 list a variety of other sections that address this issue.
The following is stated in NFPA 497, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas.
Section 3-3.3 of NFPA 497 reads as follows:
Open flames and hot surfaces associated with the operation of certain equipment, such as boilers and fired heaters, provide inherent thermal ignition sources. Electrical classification is not appropriate in the immediate vicinity of these facilities. However, it is prudent to avoid installing electrical equipment that could be a primary ignition source for potential leak sources in pumps, valves, and so forth, or in waste product and fuel feed lines.
The electrical code should address this issue in some way, shape or form.
If this proposal is not accepted then how can we justify the enforcement of 511-7. Intellectually it would be a tough argument not only to make let alone to enforce the requirements of 511-7 when we would readily permit a welder in the same room.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes this proposal deals with hot work and believes this is beyond the scope of the code. This issue should be dealt with in NFPA 51B, NFPA 30A, and NFPA 88B.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

ARTICLE 513 — AIRCRAFT HANGARS

(Log #1265)

14- 415 - (513): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: In 513-3(b), change “18 in. (457 mm)” to “450 mm (18 in.)”.
In 513-3(c), change “5 ft (1.52 m)” to “1.5 m (5 ft)” in two places in this section.
In 513-6(a), change “10 ft (3.05 m)” to “3.0 m (10 ft)”.
In 513-7(c), revise the Warning Sign to read “WARNING - KEEP 1.5 M (5 FT) CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS.”
In 513-11(a), change “18 in. (457 mm)” to “450 mm (18 in.)” in the title and the body of this section.
In 513-12(a), change “18 in. (457 mm)” to “450 mm (18 in.)”.
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Reject.
PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #2903)

14- 416 - (513): Accept in Principle
SUBMITTER: Technical Committee on Airport Facilities
RECOMMENDATION: Revise as follows:
513 Aircraft Hangars.
513-1. Scope. This article shall apply to buildings or structures inside any part of which aircraft containing Class I (flammable) liquids or Class II (combustible) liquids whose temperatures are above their flash points are housed or stored and in which aircraft might undergo service, repairs, or alterations. It shall not apply to locations used exclusively for aircraft that have never contained fuel or unfueled aircraft.
FPN No. 1: For definitions of aircraft hangar and unfueled aircraft, see Standard on Aircraft Hangars, NFPA 409-1995.
FPN No. 2: For further information on fuel classification, see Flammable and Combustible Liquids Code, NFPA 30-1996, and Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, NFPA 325-1994.
513-2. Definitions. For the purpose of this article, the following definitions shall apply. Mobile Equipment. Equipment with electric components suitable to be moved only with mechanical aids or which are provided with wheels for movements by Person(s) or powered devices.
Portable Equipment. Equipment with electric components suitable to be moved by a single person without mechanical aids.
513-3. Classification of Locations.
(a) Below Floor Level. Any pit or depression below the level of the hangar floor shall be classified as a Class I, Division 1 location that shall extend up to said floor level.
(b) Areas Not Cut Off or Ventilated. The entire area of the hangar, including any adjacent and communicating areas not suitably cut off from the hangar, shall be classified as a Class I, Division 2 location up to a level 18 in. (457 mm) above the floor.
(c) Vicinity of Aircraft. The area within 5 ft (1.52 m) horizontally from aircraft power plants or aircraft fuel tanks shall be classified as a Class I, Division 2 location that shall extend upward from the floor to a level 5 ft (1.52 m) above the upper surface of wings and of engine enclosures.
(d) Areas Suitably Cut Off and Ventilated. Adjacent areas in which flammable liquids or vapors are not likely to be released, such as stock rooms, electrical control rooms, and other similar locations, shall not be classified where adequately ventilated and where effectively cut off from the hangar itself by walls or partitions.
513-4. Wiring and Equipment in Class I Locations.
(a) All wiring and equipment that is or may be installed or operated within any of the Class I locations defined in Section 513-3 shall comply with the applicable provisions of Article 501.
Attachment plugs and receptacles in Class I locations shall be approved for Class I locations or shall be designed so that they cannot be energized while the connections are being made or broken.

(b) Electric wiring, outlets, and equipment (including lamps) on or attached to stanchions, rostrums, or docks that are located or likely to be located in a Class I location, as defined in Section 513-3(c), shall comply with the requirements for Class I, Division 2 locations.

513-5. Wiring and Equipment Embedded, Underslab, or Underground. All wiring installed in or under the hangar floor shall comply with the requirements for Class I, Division 1 locations. Where such wiring is located in vaults, pits, or ducts, adequate drainage shall be provided.

513-6. Sealing. Approved seals shall be provided in accordance with Section 501-5. Sealing requirements specified in Sections 501-5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Raceways embedded in a concrete floor or buried beneath a floor shall be considered to be within the Class I location above the floor.

513-7. Wiring and Equipment Not Within Class I Locations.

(a) Fixed Wiring. All fixed wiring in a hangar, but not within a Class I location as defined in Section 513-3, shall be installed in metal raceways or shall be Type MI, TC, or MC cable.

Exception: Wiring in unclassified locations, as defined in Section 513-3(d), shall be of a type recognized in Chapter 3.

(b) Pendants. For pendants, flexible cord suitable for the type of service and approved for hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

(c) Grounded and Grounding Conductors. Where a circuit supplies portables or pendants and includes a grounded conductor as provided in Article 200, receptacles, attachment plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of any lampholder or to the grounded terminal of any utilization equipment supplied. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the noncurrent-carrying metal portions of pendant fixtures, portable lamps, and portable utilization equipment.

(d) Arcing Equipment. In locations other than those described in Section 513-3, equipment that is less than 10 ft (3.05 m) above wings and engine enclosures of aircraft and that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, charging panels, generators, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.

Exception: Equipment in areas described in Section 513-3(d) shall be permitted to be of the general-purpose type.

(e) Lampholders, lampholders of metal-shell, fiber-lined types shall not be used for fixed incandescent lighting.

(f) Where stanchions, rostrums, or docks are not located or likely to be located in a Class I location, as defined in Section 513-3(c), wiring and equipment shall comply with Sections 513-4 and 513-7, except that such wiring and equipment not more than 18 in. (457 mm) above the floor in any position shall comply with 513-4(b). Receptacles and attachment plugs shall be of a locking type that will not readily disconnect.

(g) Mobile Type. Mobile stanchions with electric equipment complying with (f) above shall carry at least one permanently affixed warning sign to read:

WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS.

513-9. Special Equipment.

(a) Aircraft Electrical Systems.

(1) Aircraft electrical systems shall be deenergized when the aircraft is stored in a hangar and, whenever possible, while the aircraft is undergoing maintenance.

(2) Aircraft batteries shall not be charged where installed in an aircraft located inside or partially inside a hangar.

(b) Aircraft Battery Charging and Equipment. Battery chargers and their control equipment shall not be located or operated within any of the Class I locations defined in Section 513-3 and shall preferably be located in a separate building or in an area such as defined in Section 513-3(d).. Mobile chargers shall carry at least one permanently affixed warning sign to read "WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS." Tables, racks, trays, and wiring shall not be located within a Class I location and, in addition, shall comply with Article 480.

(c) External Power Sources for Energizing Aircraft.

(1) Not Less than 18 in. (457 mm) Above Floor. Aircraft energizers shall be designed and mounted so that all electrical equipment and fixed wiring will be at least 18 in. (457 mm) above floor level and shall not be operated in a Class I location as defined in Section 513-3(c).

(2) Marking for Mobile Units. Mobile energizers shall carry at least one permanently affixed warning sign to read:

WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS.

(3) Cords. Flexible cords for aircraft energizers and ground support equipment shall be approved for the type of service and extra-hard usage and shall include an equipment grounding conductor.

(d) Mobile Servicing Equipment With Electric Components.

(1) General. Mobile servicing equipment (such as vacuum cleaners, air compressors, air movers, etc.) having electric wiring and equipment not suitable for Class I, Division 2 locations shall be designed and mounted so that all such fixed wiring and equipment will be at least 18 in. (457 mm) above the floor. Such mobile equipment shall not be operated within the Class I location defined in Section 513-3(c) and shall carry at least one permanently affixed warning sign to read:

WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS.

(2) Cords and Connectors. Flexible cords for mobile equipment shall be suitable for the type of service and approved for extra-hard usage and shall include an equipment grounding conductor. Attachment plugs and rec receptacles shall be approved for the location in which they are installed and shall provide for connection of the equipment grounding conductor.

(3) Restricted Use. Equipment that is not identified as suitable for Class I, Division 2 locations shall not be operated in locations where maintenance operations likely to release flammable liquids or vapors are in progress.

(e) Portable Lighting Equipment. Portable lighting equipment that are used within a hangar shall be approved for the location in which they are used. For portable lamps, flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

(f) Portable Equipment. Portable utilization equipment that is or may be used within a hangar shall be of a type suitable for use in Class I, Division 2 locations. For portable utilization equipment flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

513-9 through 513-15 Reserved.

513-16. Grounding. All metal raceways, the metal armor or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with Section 501-16.

SUBSTANTIATION: Editorial rewrite of section. This rewrite was developed by NEC CMP 14 and balloted through the Airport Facilities Committee.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: This is accomplished by the action on Proposal 14-417.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

NOT RETURNED: 2 Earley, Saban

(Log #3971)

14- 417 - (513): Accept in Principle

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. It is the understanding of the Technical Correlating Committee that this proposal is modified by Proposals 14-420, 14-421, 14-424, 14-426, 14-429, 14-430, 14-431, 14-432, 14-433, 14-437, 14-438, 14-439, 14-440, 14-441, 14-442, 14-443, 14-444, 14-445, 14-446, 14-447, 14-448, 14-449, 14-450, and 14-451. The Technical Correlating Committee directs that the references to "Reserved Sections" be deleted, since the NEC Style Manual does not have a provision for "Reserved Sections."

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Revise the entire Article 513 as follows:

Article 513 — Aircraft Hangars

513.1. Scope. This article shall apply to buildings or structures inside any part of which aircraft containing Class I (flammable) liquids or Class II (Combustible) liquids whose temperatures are above their flash points are housed or stored an in which aircraft might undergo service, repairs, or alterations. It shall not apply to locations used exclusively for aircraft that have never contained fuel or unfueled aircraft.

FPN No. 1: For definitions of aircraft hangar and unfueled aircraft, see NFPA 409, Standard on Aircraft Hangars, 1995 edition.
FPN No. 2: For further information on fuel classification see NFPA 30, Flammable and Combustible Liquids Code, 1996 edition, and NFPA 325, Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, 1994 edition.
513.2. Definitions. For the purpose of this article, the following definitions shall apply.
Mobile Equipment. Equipment with electric components suitable to be moved only with mechanical aids or which are provided with wheels for movements by person(s) or powered devices.
Portable Equipment. Equipment with electric components suitable to be moved by a single person without mechanical aids.
513.3. Classification of Locations.
(a) Below Floor Level. Any pit or depression below the level of the hangar floor shall be classified as a Class I, Division 1 location that shall extend up to said floor level.
(b) Areas Not Cut Off or Ventilated. The entire area of the hangar, including any adjacent and communicating areas not suitably cut off from the hangar, shall be classified as a Class I, Division 2 location up to a level 18 in. (457 mm) above the floor.
(c) Vicinity of Aircraft. The area within 5 ft (1.52 m) horizontally from aircraft power plants or aircraft fuel tanks shall be classified as a Class I, Division 2 location that shall extend upward from the floor to a level 5 ft (1.52 m) above the upper surface of wings and of engine enclosures.
(d) Areas Suitably Cut Off and Ventilated. Adjacent areas in which flammable liquids or vapors are not likely to be released, such as stock rooms, electrical control rooms, and other similar locations, shall not be classified where adequately ventilated and where effectively cut off from the hangar itself by walls or partitions.
513.4. Wiring and Equipment in Class I Locations.
(a) All wiring and equipment that is or may be installed or operated within any of the Class I locations defined in Section 513.3 shall comply with the applicable provisions of Article 501.
Attachment plugs and receptacles in Class I locations shall approved for Class I locations or shall be designed so that they cannot be energized while the connections are being made or broken.
(b) Electric wiring, outlets, and equipment (including lamps) on or attached to stanchions, rostrums, or docks that are located or likely to be located in a Class I location, as defined in Section 513.3(c), shall comply with the requirements for Class I, Division 2 locations.
513.6. Sealing. Approved seals shall be provided in accordance with Section 501-5. Sealing requirements specified in Sections 501.5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Raceways embedded in a concrete floor or buried beneath a floor shall be considered to be within the Class I location above the floor.
513.7. Wiring and Equipment Not Installed in Class I Locations.
(a) Fixed Wiring. All fixed wiring in a hangar, but not installed in a Class I location as classified in Section 513.3, shall be installed in metal raceways or shall be Type MI, TC, or MC cable.
Exception: Wiring in unclassified locations, as classified in Section 513.3(d), shall be of a type recognized in Chapter 3.
(b) Pendants. For pendants, flexible cord suitable for the type of service and approved for hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.
(c) Arcing Equipment. In locations other than those described in Section 513.3, equipment that is less than 10 ft (3.05 m) above wings and engine enclosures of aircraft and that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, charging panels, generators, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.
Exception: Equipment in areas described in Section 513.3(d) shall be permitted to be of the general-purpose type.
(d) Lampholders. Lampholders of metal-shell, fiber-lined types shall not be used for fixed incandescent lighting.
(e) Stanchions, Rostrums, or Docks. Where stanchions, rostrums, or docks are not located or likely to be located in a Class I location, as defined in Section 513.3(c), wiring and equipment shall com ply with Sections 513.4 and 513.7, except that such wiring and equipment not more than 18 in. (457 mm) above the floor in any position shall comply with 513.4(b). Receptacles and attachment plugs shall be of a locking type that will not readily disconnect.
(f) Mobile Stanchions. Mobile stanchions with electric equipment complying with (e) above shall carry at least one permanently affixed warning sign to read WARNING — KEEP 5 FT CLEAR OF ARICRAFT ENGINES AND FUEL TANK AREAS.
513.8. Wiring and Equipment Embedded, Underslab, or Underground. All wiring installed in or under the hangar floor shall comply with the requirements for Class I, Division 1 locations. Where such wiring is located in vaults, pits, or ducts, adequate drainage shall be provided.
513.9. Special Equipment.
(a) Aircraft Electrical Systems.
(1) Deenergizing Aircraft Electrical Systems. Aircraft electrical systems shall be deenergized when the aircraft is stored in a hangar and, whenever possible, while the aircraft is undergoing maintenance.
(2) Aircraft Batteries. Aircraft batteries shall not be charged where installed in an aircraft located inside or partially inside a hangar.
(b) Aircraft Battery Charging and Equipment. Battery chargers and their control equipment shall not be located or operated within any of the Class I locations defined in Section 513.3 and shall preferably be located in a separate building or in an area such as defined in Section 513.3(d). Mobile chargers shall carry at least one permanently affixed warning sign to read "WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS." Tables, racks, trays, and wiring shall not be located within a Class I location and, in addition, shall comply with Article 480.
(c) External Power Sources for Energizing Aircraft.
(1) Not Less than 18 in. (457 mm) Above Floor. Aircraft energizers shall be designed and mounted so that all electric equipment and fixed wiring will be at least 18 in. (457 mm) above floor level and shall not be operated in a Class I location as defined in Section 513.3(c).
(2). Marking for Mobile Units. Mobile energizers shall carry at least one permanently affixed warning sign to read: "WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS".
(3) Cords. Flexible cords for aircraft energizers and ground support equipment shall be approved for the type of service and extra-hard usage and shall include an equipment grounding conductor.
(d) Mobile Servicing Equipment with Electric Components.
(1) General. Mobile servicing equipment (such as vacuum cleaners, air compressors, air movers, etc.) having electric wiring and equipment not suitable for Class I, Division 2 locations shall be designed and mounted so that all such fixed wiring and equipment will be at least 18 in. (457 mm) above the floor. Such mobile equipment shall not be operated within the Class I location defined in Section 513.3(c) and shall carry at least one permanently affixed warning sign to read: "WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS".
(2) Cords and Connectors. Flexible cords for mobile equipment shall be suitable for the type of service and approved for extra-hard usage and shall include an equipment grounding conductor. Attachment plugs and receptacles shall be approved for the location in which they are installed and shall provide for connection of the equipment grounding conductor.
(3) Restricted Use. Equipment that is not identified as suitable for Class I, Division 2 locations shall not be operated in locations where maintenance operations likely to release flammable liquids or vapors are in progress.
(e) Portable Equipment.
(1) Portable Lighting Equipment. Portable lighting equipment that are used within a hangar shall be approved for the location in which they are used. For portable lamps, flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.
(2) Portable Utilization Equipment. Portable utilization equipment that is or may be used within a hangar shall be of a type suitable for use in Class I, Division 2 locations. For portable utilization equipment flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.
513-10 through 513-15 Reserved.
513.16. Grounded and Grounding Requirements.
(a) General Grounding Requirements. All metal raceways, the metal armor or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with Section 501.16.
(b) Supplying Circuits with Grounded and Grounding Conductors in Class I Locations.
(1) Circuits Supplying Portable Equipment or Pendants. Where a circuit supplies portables or pendants and includes a grounded conductor as provided in Article 200, receptacles, attachment

plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of any lampholder or to the grounded terminal of any utilization equipment supplied.

(2) Approved Means. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the noncurrent-carrying metal portions of pendant fixtures, portable lamps, and portable utilization equipment.

SUBSTANTIATION: 1. Changed the Section and subsection numbering and lettering to new format to match the NEC Style Manual.

2. Moved old Section 513-5 to new Section 513.8 for "Wiring and Equipment Embedded, Underslab, or Underground" to standardize the section numbers and titles for all of the specific hazardous location.

3. In Section 513.7, removed the word "within" in both the title and the text and replaced it with the words "installed in" since the application deals with wiring and equipment installed in the hazardous location. Also changed the word "defined" "as classified" since Section 513.3 provides classification for these locations and not definitions.

4. Moved old Section 513-7(c) dealing with grounded and grounding conductors to Section 513.16(b) to be consistent with the other Haz Loc articles and since that information should be located within the Section dealing with grounding and bonding in a hazardous location. The other subsections have been re-lettered to indicate the deletion of (c).

5. New titles for subsections have been created to comply with the NEC Style Manual.

PANEL ACTION: Accept in Principle.

Accept the recommended text, but renumber as follows 513-6 to 513-9 and 513-9 to 513-10.

PANEL STATEMENT: The minor changes implement a standardized numbering format for Articles 511 through 516.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

(Log #3974)

14- 418 - (513): Accept in Principle

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Revise the entire Article 513 as follows:

Article 513 — Aircraft Hangars

513.1. Scope. This article shall apply to buildings or structures inside any part of which aircraft containing Class I (flammable) liquids or Class II (Combustible) liquids whose temperatures are above their flash points are housed or stored an in which aircraft might undergo service, repairs, or alterations. It shall not apply to locations used exclusively for aircraft that have never contained fuel or unfueled aircraft.

FPN No. 1: For definitions of aircraft hangar and unfueled aircraft, see NFPA 409, Standard on Aircraft Hangars, 1995 edition.

FPN No. 2: For further information on fuel classification see NFPA 30, Flammable and Combustible Liquids Code, 1996 edition, and NFPA 325, Guide to Fire Hazard Properties of Flammable Liquids, Gases, and Volatile Solids, 1994 edition.

513.2. Definitions. For the purpose of this article, the following definitions shall apply.

Mobile Equipment. Equipment with electric components suitable to be moved only with mechanical aids or which are provided with wheels for movements by person(s) or powered devices.

Portable Equipment. Equipment with electric components suitable to be moved by a single person without mechanical aids.

513.3. Classification of Locations.

(a) Below Floor Level. Any pit or depression below the level of the hangar floor shall be classified as a Class I, Division 1 location that shall extend up to said floor level.

(b) Areas Not Cut Off or Ventilated. The entire area of the hangar, including any adjacent and communicating areas not suitably cut off from the hangar, shall be classified as a Class I, Division 2 location up to a level 18 in. (457 mm) above the floor.

(c) Vicinity of Aircraft. The area within 5 ft (1.52 m) horizontally from aircraft power plants or aircraft fuel tanks shall be classified as a Class I, Division 2 location that shall extend upward from the floor to a level 5 ft (1.52 m) above the upper surface of wings and of engine enclosures.

(d) Areas Suitably Cut Off and Ventilated. Adjacent areas in which flammable liquids or vapors are not likely to be released, such as stock rooms, electrical control rooms, and other similar locations, shall not be classified where adequately ventilated and where effectively cut off from the hangar itself by walls or partitions.

513.4. Wiring and Equipment in Class I Locations.

(a) All wiring and equipment that is or may be installed or operated within any of the Class I locations defined in Section 513.3 shall comply with the applicable provisions of Article 501.

All wiring installed in or under the hangar floor shall comply with the requirements for Class I, Division 1 locations. Where such wiring is located in vaults, pits, or ducts, adequate drainage shall be provided.

Attachment plugs and receptacles in Class I locations shall be approved for Class I locations or shall be designed so that they cannot be energized while the connections are being made or broken.

(b) Electric wiring, outlets, and equipment (including lamps) on or attached to stanchions, rostrums, or docks that are located or likely to be located in a Class I location, as defined in Section 513.3(c), shall comply with the requirements for Class I, Division 2 locations.

513.5 Wiring and Equipment Embedded, Underslab, or Underground. All wiring installed in or under the hangar floor shall comply with the requirements for Class I, Division 1 locations. Where such wiring is located in vaults, pits, or ducts, adequate drainage shall be provided.

513.6. Sealing. Approved seals shall be provided in accordance with Section 501.5. Sealing requirements specified in Sections 501.5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Raceways embedded in a concrete floor or buried beneath a floor shall be considered to be within the Class I location above the floor.

513.7. Wiring and Equipment Not Within Class I Locations.

(a) Fixed Wiring. All fixed wiring in a hangar, but not within a Class I location as defined in Section 513.3, shall be installed in metal raceways or shall be Type MI, TC, or MC cable.

Exception: Wiring in unclassified locations, as defined in Section 513.3(d), shall be of a type recognized in Chapter 3.

(b) Pendants. For pendants, flexible cord suitable for the type of service and approved for hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

(c) Portable Equipment. For portable utilization equipment and lamps, flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

(~~c~~d) Grounded and Grounding Conductors. Where a circuit supplies portables or pendants and includes a grounded conductor as provided in Article 200, receptacles, attachment plugs, connectors, and similar devices shall be of the grounding type, and the grounded conductor of the flexible cord shall be connected to the screw shell of any lampholder or to the grounded terminal of any utilization equipment supplied. Approved means shall be provided for maintaining continuity of the grounding conductor between the fixed wiring system and the noncurrent-carrying metal portions of pendant fixtures, portable lamps, and portable utilization equipment.

513.6. Equipment Not Within Class I Locations.

(~~d~~a) Arcing Equipment. In locations other than those described in Section 513.3, equipment that is less than 10 ft (3.05 m) above wings and engine enclosures of aircraft and that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, charging panels, generators, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or constructed so as to prevent the escape of sparks or hot metal particles.

Exception: Equipment in areas described in Section 513.3(d) shall be permitted to be of the general-purpose type.

(~~a~~b) Lampholders. Lampholders of metal-shell, fiber-lined types shall not be used for fixed incandescent lighting.

(c) Portable Lighting Equipment. Portable lighting equipmetn that are used iwthin a hangar shall be approved for the location in which they are used.

(d) Portable Equipment. Portable utilization equipmetn that is or may be used within a hanger shall be of a type suitable for use in Class I, Division 2 locations.

513.7 Stanchions, Rostrums, and Docks.

(a) In Class I Location. Electric wiring, outlets, and equipment (includign lamps) on or attached totanchions, rostrums, or docks that are located or likely to be located in a Class I location, as defined in Section 513.3(c), shall comply with the requirements for Class I, Division 2 locations.

(~~f~~b) Not in Class I Location. Where stanchions, rostrums, or docks are not located or likely to be located in a Class I location, as defined in Section 513-3(c), wiring and equipment shall comply with Sections 513.5 and 513.6, except that such wiring and equipment not more than 18 in. (457 mm) above the floor in any position shall comply with 513.7(a). Receptacles and attachment plugs shall be of a locking type that will not readily disconnect.

(~~g~~c) Mobile Type. Mobile stanchions with electric equipment complying with (b) above shall carry at least one permanently affixed warning sign to read: WARNING — KEEP 5 FT CLEAR OF ARICRAFT ENGINES AND FUEL TANK AREAS.

513.8. Sealing. Approved seals shall be provided in accordance with Section 501.5. Sealing requirements specified in Sections 501.5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Raceways embedded in a concrete floor or buried beneath a floor shall be considered to be within the Class I location above the floor.

513.9. Special Equipment.

(a) Aircraft Electrical Systems.

(1) Aircraft electrical systems shall be deenergized when the aircraft is stored in a hangar and, whenever possible, while the aircraft is undergoing maintenance.

513.10. Aircraft Batteries — Charging and Equipment(2). Aircraft batteries shall not be charged where installed in an aircraft located inside or partially inside a hangar.

(b) Aircraft Battery Charging and Equipment. Battery chargers and their control equipment shall not be located or operated within any of the Class I locations defined in Section 513.3 and shall preferably be located in a separate building or in an area such as defined in Section 513.3(d). Mobile chargers shall carry at least one permanently affixed warning sign to read "WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS." Tables, racks, trays, and wiring shall not be located within a Class I location and, in addition, shall comply with Article 480.

513.11.(c) External Power Sources for Energizing Aircraft.

(1~~a~~) Not Less than 18 in. (457 mm) Above Floor. Aircraft energizers shall be designed and mounted so that all electric equipment and fixed wiring will be at least 18 in. (457 mm) above floor level and shall not operated in a Class I location as defined in Section 513.3(c).

(2~~b~~) Marking for Mobile Units. Mobile energizers shall carry at least one permanently affixed warning sign to read: "WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS."

(3~~c~~) Cords. Flexible cords for aircraft energizers and ground support equipment shall be approved for the type of service and extra-hard usage and shall include an equipment grounding conductor.

513.12.~~(d)~~ Mobile Servicing Equipment with Electric Components.

(1~~a~~) General. Mobile servicing equipment (such as vacuum cleaners, air compressors, air movers, etc.) having electric wiring and equipment not suitable for Class I, Division 2 locations shall be designed and mounted so that all such fixed wiring and equipment will be at least 18 in. (457 mm) above the floor. Such mobile equipment shall not be operated within the Class I location defined in Section 513.3(c) and shall carry at least one permanently affixed warning sign to read: "WARNING — KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS."

(2~~b~~) Cords and Connectors. Flexible cords for mobile equipment shall be suitable for the type of service and approved for extra-hard usage and shall include an equipment grounding conductor. Attachment plugs and receptacles shall be approved for the location in which they are installed and shall provide for connection of the equipment grounding conductor.

(3~~c~~) Restricted Use. Equipment that is not identified as suitable for Class I, Division 2 locations shall not be operated in locations where maintenance operations likely to release flammable liquids or vapors are in progress.

(e) Portable Lighting Equipment. Portable lighting equipment that are used within a hangar shall be approved for the location in which they are used. For portable lamps, flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

(f) Portable Equipment. Portable utilization equipment that is or may be used within a hangar shall be of a type suitable for use in Class I, Division 2 locations. For portable utilization equipment flexible cord suitable for the type of service and approved for extra-hard usage shall be used. Each such cord shall include a separate equipment grounding conductor.

513.16. Grounding. All metal raceways, the metal armor or metallic sheath on cables and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with Section 501-16.

SUBSTANTIATION: This proposal is the work of a Task Group including Donny Cook, Fred Walker, Gordon Johnson, Don Zipsi, Mark Goodman, Kevin Earley, Mark Ode, Bob Benedetti, and Richard Hild. The Task Group was not balloted. The purpose of this proposal is to provide parallel numbering from Article 511 through 516 to comply with Section 2.4.1 of the NEC Style Manual.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: This is accomplished by the action on Proposal 14-417.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban
COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #3906)

14- 419 - (513-1): Reject

Note: The Technical Correlating Committee directs that this Proposal be referred to the NFPA 409, Technical Committee on Airport Facilities, for comment.
SUBMITTER: Ronald E. Gnotke, Rep. Minnesota Board of Electricity
RECOMMENDATION: Recommend a text change at the end of this section to read:

513-1. Scope. It shall not apply to locations used exclusively for aircraft that have never contained fuel, unfueled aircraft, or attached or detached structures on residential property at or near airstrips used to store two or less, single engine aircraft.

SUBSTANTIATION: There are numerous airstrips around where there is a housing development with residential lots on each side of an air strip where the residents own and store these small aircraft in attached or detached "garages" or "pole type" structures on their private property. The installations are similar to a three or four car attached garage, but a garage of this type isn't required to be wired in compliance with Article 511. This proposal is being submitted to obtain a clarification on this type of installation to assist installers and electrical inspectors in e proper compliance with accepted standards for protection of the property and safety of the residence in the dwelling. Some consideration might be given to the number, aircraft allowed in a nonclassified structure attached to a dwelling.
PANEL ACTION: Reject.
PANEL STATEMENT: Classification of the hangar is the responsibility of NFPA 409. The Correlating Committee is responsible for establishing scope statements.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #1489)

14- 420 - (513-2-Spray Area, Spray Booth, Spray Room (New)): Accept in Principle
SUBMITTER: Fred K. Walker, US Air Force
RECOMMENDATION: Add a new definitions to Article 513:

For the purpose of this article, the following definitions shall apply.

Spray Area. Normally locations outside of buildings or localized operations within a larger room or space. Such are normally provided with some local vapor extraction/ventilation system. In automated operations the area limits shall be the maximum area in the direct path of spray operations. In manual operations the area limits shall be the maximum area of spray when aimed at 180 degrees to the application surface.

Spray Booth. An enclosure or insert within a larger room used for spray/coating/dipping applications. A spray booth may be fully enclosed or have open front or face and may include separate conveyor entrance and exit openings. The spray booth is provided with a dedicated ventilation exhaust but may draw supply air from the larger room or have a dedicated air supply.

Spray Room. A purpose built fully enclosed room constructed for spray/coating/dipping applications provided with dedicated

ventilation supply and exhaust. Other operations may be conducted in the room however a primary purpose of the room is to provide a controlled environment for the application of spray/coating/dipping operations. Normally the room is configured to house the item to be painted providing access around the item/process. Depending on the size of the item being painted such rooms may actually be the entire building or the major portion thereof.

SUBSTANTIATION: The article is not clear as to what a spray area, spray booth, or spray room is. This results in wide variations in what is often defined as the classified area or the degree to which areas are classified. In one case an enclosed room with dedicated supply and exhaust ventilation, the spray area has been defined as the surface of the item being painted/coated resulting no classifed equipment being required - in an exact copy of the room painting the same item at another location the entire room was required to be Class I Division 1.

The proposal more clearly defines what each of these areas are and in the case of a spray area provided some guidance in measuring/determining the spray area.

PANEL ACTION: Accept in Principle.

Add to 516 the definitions of "spray area", "spray booth", "spray room" verbatim from the 1995 edition of NFPA 33 and mark as extracted text.

PANEL STATEMENT: The panel believes the definitions from NFPA 33 need to be added to 516-2.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #3026)

14- 421 - (513-3): Accept

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Revise text as follows:

513-3. Classification of Locations.

(a) Below Floor Level. Any pit or depression below the level of the hangar floor shall be classified as a Class I, Division 1 or Zone 1 location that shall extend up to said floor level.

(b) Areas Not Cut Off or Ventilated. The entire area of the hangar, including any adjacent and communicating areas not suitably cut off from the hangar, shall be classified as a Class I, Division 2 or Zone 2 location up to a level 18 in. (457 mm) above the floor.

(c) Vicinity of Aircraft. The area within 5 ft (1.52 m) horizontally from aircraft power plants or aircraft fuel tanks shall be classified as a Class I, Division 2 or Zone 2 location that shall extend upward from the floor to a level 5 ft (1.52 m) above the upper surface of wings and of engine enclosures.

SUBSTANTIATION: This proposal is to recognize the alternate method for classification that was introduced into the 1996 National Electrical Code. (See also proposal for Article 514-8.)

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

COOK: Since Article 505 was included in the 1996 NEC, I am only aware of one major project that utilized the Zone concept. This was a project that was provided significant financial and engineering backing and it proved to be a challenge to install. To permit this to happen in the Specific Occupancies, Articles 5-11-515, which will not have the financial and engineering support will be a mistake in my opinion. If Proposal 14-348 is accepted and the supervision of qualified registered professional engineering is removed, we would be allowing a segment of the electrical industry that has little or no experience with the zone concept to use a method that is still quite complex. These facilities are places where our families have access on a daily basis.

I also do not believe the concept has been adopted in the current editions of NFPA Standards for these occupancies.

(Log #2404)

14- 422 - (513-3(d)): Reject

SUBMITTER: William E. Bickner, Stillwater, MN

RECOMMENDATION: Add the following sentence after the existing text:

"Separating walls or partitions shall be permitted to have openings that are not within or partially within a Class I location, provided that the air pressure within such adjacent locations is maintained by mechanical ventilation and exceeds that within the hangar."

SUBSTANTIATION: The present provisions are silent on the matter of openings within separating walls or partitions, which strongly implies that no openings are permitted. This imposes seemingly unnecessary restrictions on areas such as classrooms or living quarters. The proposed change would permit openings under conditions that would assure no meaningful communication of flammable gases into the adjacent areas, keeping in mind that Division 2 locations are being addressed.

PANEL ACTION: Reject.

PANEL STATEMENT: Requirements for purging and pressurization are contained in NFPA 496 and these concepts can be applied to reduce the area classification of the space in question.

14- 424 - (513-4): Accept

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI

RECOMMENDATION: Revise second paragraph to read as follows:

Attachment plugs and receptacles in Class I locations shall be ~~approved~~ (identified) for Class I locations or shall be designed so that they cannot be energized while the connections are being made or broken.

SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

PANEL ACTION: Accept.

PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

14- 425 - (513-4): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise the second paragraph as shown below:
"Attachment plugs and receptacles in Class I locations shall be approved for Class I locations ~~or shall be designed so that they cannot be energized while the connections are being made or broken~~."
SUBSTANTIATION: The first paragraph of this section requires wiring and equipment in Class I locations to comply with the applicable provisions of Article 501. Section 501-12 requires receptacles and attachment plugs in Class I, Div. 1 or 2, to be approved for the location. Section 513-7(a) requires outlets in Class I locations in the vicinity of the aircraft to comply with the requirements for Class I, Division 2 locations. The material proposed for deletion conflicts with those requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed deleted text is an intentional modification of 501-12 to accomodate specialized aircraft power equipment.

513-12(a) General. Mobile servicing equipment (such as vacuum cleaners, air compressors, air movers, etc.) having electric wiring and equipment not suitable for Class I, Division 2 locations shall be designed and mounted so that all such fixed wiring and equipment will be at least 18 in. (457 mm) above the floor. Such mobile equipment shall not be operated within the Class I location defined in Section 513-3(c) and shall carry at least one permanently affixed warning sign ~~to read~~ with the following words or equivalent:

WARNING - KEEP 5 FT CLEAR OF AIRCRAFT ENGINES AND FUEL TANK AREAS.

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

NOT RETURNED: 2 Earley, Saban

(Log #1651)

14- 448 - (513-12(b)): Accept
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI
RECOMMENDATION: Revise first sentence to read as follows:
Flexible cords for mobile equipment shall be suitable for the type of service and ~~approved~~ (identified) for extra-hard usage and shall include an equipment grounding conductor.
SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

ARTICLE 514 — GASOLINE DISPENSING AND SERVICE STATIONS

(Log #1266)

14- 452 - (514): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: In Table 514-2, change the text in the last column of the table as shown below: (Note: There are 38 places where SI dimensions are added.)
Any pit, box, or space below grade level, any part of which is within the Division 1 or 2 classified location.
Up to ~~18 in.~~ 450 mm (18 in.) above grade level within a horizontal radius of ~~10 ft~~ 3.0 m (10 ft) from a loose fill connection and within a horizontal radius of ~~5 ft~~ 1.5 m (5 ft) from a tight fill connection.
Within ~~3 ft~~ 900 mm (3 ft) of open end of vent, extending in all directions.
Space between ~~3 ft~~ 900 mm (3 ft) and ~~5 ft~~ 1.5 m (5 ft) of open end of vent, extending in all directions.
Any pit, box, or space below grade level, any part of which is within the Division 1 or 2 classified location.
FPN: Space classification inside the dispenser enclosure is covered in Power Operated Dispensing Devices for Petroleum Products, ANSI/UL 87-1995.
Within ~~18 in.~~ 450 mm (18 in.) horizontally in all directions extending to grade from the dispenser enclosure or that portion of the dispenser enclosure containing liquid handling components.
FPN: Space classification inside the dispenser enclosure is covered in Power Operated Dispensing Devices for Petroleum Products, ANSI/UL 87-1995.
Up to ~~18 in.~~ 450 mm (18 in.) above grade level within ~~20 ft~~ 6.0 m (20 ft) horizontally of any edge of enclosure.
Up to ~~18 in.~~ 450 mm (18 in.) above grade or floor level within ~~20 ft~~ 6.0 m (20 ft) horizontally of any edge of enclosure.

Up to ~~18 in.~~ 450 mm (18 in.) above grade or floor level within ~~25 ft~~ 7.5 m (25 ft) horizontally of any edge of enclosure.

The space within the dispenser enclosure, and all electrical equipment integral with the dispensing hose or nozzle.

A space extending ~~18 in.~~ 450 mm (18 in.) horizontally in all directions beyond the enclosure and extending to grade.

Up to ~~18 in.~~ 450 mm (18 in.) above grade level within ~~20 ft~~ 6.0 m (20 ft) horizontally measured from a point vertically below the edge of any dispenser enclosure.

Any pit, box, or space below grade level if any part is within a horizontal distance of ~~10 ft~~ 3.0 m (10 ft) from any edge of pump.

Within ~~3 ft~~ 900 mm (3 ft) of any edge of pump, extending in all directions. Also up to ~~18 in.~~ 450 mm 18 in. above grade level within ~~10 ft~~ 3.0 m (10 ft) horizontally from any edge of pump.

Entire space within any pit.

Within ~~5 ft~~ 1.5 m (5 ft) of any edge of pump, extending in all directions. Also up to ~~3 ft~~ 900 mm (3 ft) above grade level within ~~25 ft~~ 7.5 m (25 ft) horizontally from any edge of pump.

Any pit within any unventilated space.

Any pit within ventilation.

Space up to ~~18 in.~~ 450 mm (18 in.) above floor or grade level and ~~3 ft~~ 900 mm (3 ft) horizontally from a lubrication pit.

Within ~~3 ft~~ 900 mm (3 ft) of any fill or dispensing point, extending in all directions. Entire area within any pit used for lubrication or similar services where Class I liquids may be released.

Area up to ~~18 in.~~ 450 mm (18 in.) above any such pit, and extending a distance of ~~3 ft~~ 900 mm (3 ft) horizontally from any edge of the pit.

Entire unventilated area within any pit, below grade area, or subfloor area.

Area up to ~~18 in.~~ 450 mm (18 in.) above any such unventilated pit, below grade work area, or subfloor work area and extending a distance of ~~3 ft~~ 900 mm (3 ft) horizontally from the edge of any suchpit, below grade work area, or subfloor work area.

Any pit, below grade work area, or subfloor work area that is provided with exhaust ventilation at a rate of not less than ~~1 cfm/ft^2(0.3 m^3/minute/m^2)~~ 0.3 m^3/min/m^2(1 cfm/ft^2) of floor area at all times that the building is occupied or when vehicles are parked in or over this area and where exhaust air is taken from a point within ~~12 in. (0.3 m)~~ 300 mm (12 in.) of the floor of the pit, below grade work area, or subfloor work area.

Entire enclosure.

If there is any opening to these rooms within the extent of a Division 1 location, the entire room shall be classified as Division 1.

Any pit, box, or space below grade level, any part of which is within a Division 1 or 2 classified location or that houses any equipment used to transport or process vapors.

Within any protective enclosure housing vapor processing equipment.

The space within ~~18 in.~~ 450 mm (18 in.) in all directions of equipment containing flammable vapor or liquid extending to grade level. Up to ~~18 in.~~ 450 mm (18 in.) above grade level within ~~10 ft~~ 3.0 m (10 ft) horizontally of the vapor processing equipment.

Any space within the enclosure where vapor or liquid is present under normal operating conditions. The space within ~~18 in.~~ 450 mm (18 in.) in all directions extending to grade level. Up to ~~18 in.~~ 450 mm (18 in.) above grade level within ~~10 ft~~ 3.0 m (10 ft) horizontally.

In Table 514-2, delete "For SI units, 1 in. = 2.5 cm; 1 ft = 0.3048 m" at the bottom of the table.

In Figure 514-2, change "18 in." to "450 mm (18 in.)" in three places; "20 ft" to "6.0 m (20 ft)" in three places.

In Figure 514-2, delete "For SI units: 1 in. = 25.4 mm; 1 ft = 0.3048 m" at the bottom of the figure.

In 514-5(b), change "100 ft (30 m)" to "30 m (100 ft)".

In 514-5(c), change "20 ft (7 m)" to "6 m (20 ft)" and "100 ft (30 m)" to "30 m (100 ft)".

In 514-8, Exception No. 2, change "2 ft (610 mm)" to "600 mm (24 in.)" in two places.

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4-1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Reject.

PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:
AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:
KUCZKA: See my Explanation of Negative Vote on Proposal 14-10.
OMEARA: The proposal should be accepted, to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.
ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #1525)

14- 453 - (514): Accept

SUBMITTER: Marshall A. Klein, Marshall A. Klein & Assoc., Inc./Rep. Automotive Oil Change Assn. (AOCA)

RECOMMENDATION: Revise text as follows:

1. Article 514 – ~~Gasoline Dispensing and Service Stations~~ Motor Fuel Dispensing Facilities.

2. Section 514-1: Definition. A ~~gasoline dispensing and service station~~ motor fuel dispensing facility is a location where gasoline or other volatile flammable liquid or liquefied flammable gases are transferred to the fuel tanks (including auxiliary fuel tanks) of self-propelled vehicles or approved containers.

3. Section 514-2. Class I Locations. Table 514-2 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify ~~service stations~~ motor fuel dispensing facilities, and commercial garages as defined under Article 511.

4. ^{x}Table 514-2, Class I Locations – ~~Service Stations~~ Motor Fuel Dispensing Facilities and Commercial Garages.

5. Section 514-5^{x}(b) Attended Self-Service ~~Stations~~ Motor Fuel Dispensing Facilities.

6. Section 514-5^{x}(c) Unattended Self-Service ~~Stations~~ Motor Fuel Dispensing Facilities.

SUBSTANTIATION: NFPA 30A is in the process of an entire rewrite of NFPA 30A. The committee is also attempting to incorporate NFPA 88B into NFPA 30A. If this rewrite is approved by the NFPA 30A Committee at its meeting in November, 1999, then the NFPA 30A Committee will need to forward to the NEC code proposals to correlate Chapter 8 of NFPA 30A with Article 514 of the NEC. Since I am a member of the NFPA 30A Committee, and since our committee's work will not be completed by the 11/5/99 deadline for proposals to the NEC, I am respectfully submitting this code proposal to permit the NEC Panel 14 and the NFPA 30A Committee to be able to correlate the next edition of the NEC with the 2000 edition of NFPA 30A.

Changes to the NEC will be required to correlate with the next edition of NFPA 30A. Proposed new definitions for "motor fuel dispensing facility" and "major and minor repair garages" are used in place of "service station" in the next edition of NFPA 30A.

PANEL ACTION: Accept.

(Log #3975)

14- 454 - (514):

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee rejects the Panel Action. The second paragraph contains requirements which are not permitted in a Scope Statement. The Technical Correlating Committee directs that the Scope be only the first paragraph of the Recommendation, and directs the panel to relocate the second paragraph elsewhere in the Article. Technical Correlating Committee understands that this proposal is modified by Proposals 14-453, 14-459, 14-460, 14-462, 14-467a and 14-470. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Revise the entire Article 514 as follows:

Article 514 — Gasoline Dispensing and Service Stations

514.1. Scope. These occupancies shall include locations where gasoline or other volatile flammable liquids or liquefied flammable gases are transferred to the fuel tanks (including auxiliary fuel tanks) of self-propelled vehicles or approved containers.

Other areas used as lubritoriums, service rooms, repair rooms, offices, salesrooms, compressor rooms, and similar locations shall

comply with Articles 510 and 511 with respect to electric wiring and equipment.

FPN: For further information regarding safeguards for gasoline dispensing and service stations, see NFPA 30A, Automotive and Marine Service Station Code, 1996 edition.

514.2. Definition. A gasoline dispensing and service station is a location where gasoline or other volatile flammable liquids or liquefied flammable gases are transferred to the fuel tanks (including auxiliary fuel tanks) of self-propelled vehicles or approved containers.

x514.3. Classification of Locations.

(a) Unclassified Locations. Where the authority having jurisdiction can satisfactorily determine that flammable liquids having a flash point below 38°C (100°F), such as gasoline, will not be handled, such location shall not be required to be classified.

(b) Classified Locations.

(1) Class I Locations. Table 514.3 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify service stations. A Class I location shall not extend beyond an unpierced wall, roof, or other solid partition.

FPN No. 1: For information on area classification where liquefied petroleum gases are dispensed, see NFPA 58, Standard for the Storage and Handling of Liquefied Petroleum Gases, 1995 edition.

FPN No. 2: For information on classified areas pertaining to LP-Gas systems other than residential or commercial, see NFPA 58, Standard for the Storage and Handling of Liquefied Petroleum Gases, 1995 edition, and NFPA 59, Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, 1995 edition.

FPN No. 3: See Section 555.10 for gasoline dispensing stations in marinas and boatyards.

xFigure 514.3. Classified locations adjacent to dispensers as detailed in Table 514.3.

514.4. Wiring and Equipment Installed in Class I Locations. All electrical equipment and wiring installed in Class I locations as classified in Section 514.3 shall comply with the applicable provisions of Article 501.

Exception: As permitted in Section 514.8.

FPN: For special requirements for conductor insulation, see Section 501.13.

514.7. Wiring and Equipment Above Class I Locations. Wiring and equipment above the Class I locations as classified in Section 514.3 shall comply with Section 511.7.

514.8. Underground Wiring. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit. Any portion of electrical wiring or equipment that is below the surface of a Class I, Division 1 or Division 2 location (as classified in Table 514.3) shall be considered to be in a Class I, Division 1 location, which shall extend at least to the point of emergence above grade. Refer to Table 300.5.

Exception No. 1: Type MI cable shall be permitted where it is installed in accordance with Article 330.

Exception No. 2: Rigid nonmetallic conduit complying with Article 347 shall be permitted where buried under not less than 2 ft (610 mm) of cover. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 2 ft (610 mm) of the underground run to emergence or to the point of connection to the aboveground raceway, and an equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

514.10. Sealing.

(a) At Dispenser. An approved seal shall be provided in each conduit run entering or leaving a dispenser or any cavities or enclosures in direct communication therewith. The sealing fitting shall be the first fitting after the conduit emerges from the earth or concrete.

(b) At Boundary. Additional seals shall be provided in accordance with Section 501.5. Sections 501.5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations.

514.11. Circuit Disconnects.

(a) General. Each circuit leading to or through dispensing equipment, including equipment for remote pumping systems, shall be provided with a clearly identified and readily accessible switch or other acceptable means, located remote from e dispensing devices, to disconnect simultaneously from the source of supply, all conductors of the circuits, including the grounded conductor, if any.

Single-pole breakers utilizing handle ties shall not be permitted.

x(b) Attended Self-Service Stations. Emergency controls as specified in 514.11(a) shall be installed at a location acceptable to the authority having jurisdiction, but controls shall not be more than 100 ft (30 m) from dispensers.

x(c) Unattended Self-Service Stations. Emergency controls as specified in 514.11(a) shall be installed at a location acceptable to the authority having jurisdiction, but the control shall be more than 20 ft (7 m) but less than 100 ft (30 m) from the dispensers. Additional emergency controls shall be installed on each group of dispensers or the outdoor equipment used to control the dispensers. Emergency controls shall shut off all power to all dispensing equipment at the station. Controls shall be manually reset only in a manner approved by the authority having jurisdiction.

FPN: For additional information, see 9-4.5 and 9-5.3 of NFPA 30A, Automotive and Marine Service Station Code, 1996 edition.

514.12. Provisions for Maintenance and Service of Dispensing Equipment. Each dispensing device shall be provided with a means to remove all external voltage sources, including feedback, during periods of maintenance and service of the dispensing equipment.

514.16. Grounding. All metal raceways, the metal armor or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with Section 501.16.

SUBSTANTIATION: 1. Section 514-1 that provided definitions for Article 514 has been moved to 514.2 to conform to the NEC Style Manual.

2. Section 514-1 is a new section providing a scope for Article 514.

3. The three FPNs that were located in Section 514-1 for definitions have been relocated. The FPN providing information on NFPA 30A has been left in the Scope since it provides information on the basis for the text in Article 514. The other two FPNs have been moved to Section 514.3(b)(1) since they deal with information on documents providing area classification.

4. Section 514.2, Table 514.2, and Figure 514.2 have been changed to Section 514.3, Table 514.3, and Figure 514.3 to provide consistency with the other specific hazardous location occupancies.

5. A new subsection 514.3(a) has been established for unclassified locations and the paragraph dealing with areas where the flammable liquids have a flashpoint greater than 100°F has been moved from the definition section to this new location.

6. Section 514.3 was changed to Section 514.4 to provide consistency between the various articles dealing with specific hazardous location occupancies. The word "within" was changed to "installed in" in both the title and in the text since the equipment and wiring is actually installed in this location and not just simply located within the area. The word "defined" was changed to "as classified" since old Section 514-2 (new Section 514.3) does not define the hazardous area; it provides the area classification requirements.

7. Old Section 514-4 for Wiring and Equipment Above Class I Locations has been moved to new Section 514.7 for consistency between the articles.

8. Section 514.5 covering circuit disconnecting means for dispensers and dispenser islands and Section 514.6 covering the provisions for maintenance and servicing of dispensing equipment have been moved to new Sections 514.11 and 514.12, respectively.

9. Old Section 514-7 for sealing of raceways at dispensers has been moved to new Section 514.10 for consistency between articles.

This proposal is the work of a Task Group including Donny Cook, Fred Walker, Gordon Johnson, Don Zipsi, Mark Goodman, Kevin Earley, Mark Ode, Bob Benedetti, and Richard Hild. The Task Group was not balloted. The purpose of the proposal is to provide parallel numbering from Article 511 through 516 to comply with Section 2.4.1 of the NEC Style Manual.

PANEL ACTION: Accept in Principle.

Accept the submitter's text, but renumber 514-10 to 514-9 and 514-12 to 514-13. Also, change the word "nonclassified" to "unclassified" wherever the term appears.

PANEL STATEMENT: The minor changes implement a standardized numbering format for Articles 511 through 516.

COMMENT ON AFFIRMATIVE:

WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

---

xTable 514.3. Class I Locations — Service Stations

Location	Class I, Group D Division	Extent of Classified Location1
Underground Tank		
Fill Opening	1	Any pit, box, or space below grade level, any part of which is within the Division 1 or 2 classified location.
	2	Up to 18 in. above grade level within a horizontal radius of 10 ft from a loose fill connection and within a horizontal radius of 5 ft from a tight fill connection.
Vent — Discharging Upward	1	Within 3 ft of open end of vent, extending in all directions.
	2	Space between 3 ft and 5 ft of open end of vent, extending in all directions.
Dispensing Device[1,4] (except overhead type)[2]		
Pits	1	Any pit, box, or space below grade level, any part of which is within the Division 1 or 2 classified location.
Dispenser		FPN: Space classification inside the dispenser enclosure is covered in Power Operated Dispensing Devices for Petroleum Products, ANSI/UL 87-1995.
	2	Within 18 in. horizontally in all directions extending to grade from the dispenser enclosure or that portion of the dispenser enclosure containing liquid handling components. FPN: Space classification inside the dispenser enclosure is covered in Power Operated Dispensing Devices for Petroleum Products, ANSI/UL 87-1995.
Outdoor	2	Up to 18 in. above grade level within 20 ft horizontally of any edge of enclosure.
Indoor		
with Mechanical Ventilation	2	Up to 18 in. above grade or floor level within 20 ft horizontally of any edge of enclosure.
with Gravity Ventilation	2	Up to 18 in. above grade or floor level within 25 ft horizontally of any edge of enclosure.
Dispensing Device[4]		
Overhead Type[2]	1	The space within the dispenser enclosure, and all electrical equipment integral with the dispensing hose or nozzle.
	2	A space extending 18 in. horizontally in all directions beyond the enclosure and extending to grade.
	2	Up to 18 in. above grade level within 20 ft horizontally measured from a point vertically below the edge of any dispenser enclosure.
Remote Pump — Outdoor	1	Any pit, box, or space below grade level if any part is within a horizontal distance of 10 ft from any edge of pump.
	2	Within 3 ft of any edge of pump, extending in all directions. Also up to 18 in. above grade level within `10 ft horizontally from any edge of pump.
Remote Pump — Indoor	1	Entire space within any pit.
	2	Within 5 ft of any edge of pump, extending in all directions. Also up to 3 ft above grade level within 25 ft horizontally from any edge of pump.
Lubrication or Service Room — with Dispensing	1	Any pit within any unventilated space.
	2	Any pit with ventilation.
	2	Space up to 18 in. above floor or grade level and 3 ft horizontally from a lubrication pit.
Dispenser for Class I Liquids	2	Within 3 ft of any fill or dispensing point, extending in all directions.
Lubrication or Service Room — Without Dispensing	2	Entire area within any pit used for lubrication or similar services where Class I liquids may be released.
	2	Area up to 18 in. above any such pit, and extending a distance of 3 ft horizontally from any edge of the pit.
	2	Entire unventilated area within any pit, below grade area, or subfloor area.
	2	Area up to 18 in. above any such unventilated pit, below grade work area, or subfloor work area and extending a distance of 3 ft horizontally from the edge of any such pit, below grade work area, or subfloor work area.
	Nonclassified	Any pit, below grade work area, or subfloor work area that is provided with exhaust ventilation at a rate of not less than 1 cfm/ft^2 (0.3 m^3/minute/m^2) of floor area at all times that the building is occupied or when vehicles are parked in or over this area and where exhaust air is taken from a point within 12 in. (0.3 m) of the floor of the pit, below grade work area, or subfloor work area.
Special Enclosure Inside Building[3]	1	Entire enclosure.
Sales, Storage, and Rest Rooms	Nonclassified	If there is any opening to these rooms within the extent of a Division 1 location, the entire room shall be classified as Division 1.

Vapor Processing Systems Pits	1	Any pit, box, or space below grade level, any part of which is within a Division 1 or 2 classified location or that houses nay equipment used to transport or process vapors.
Vapor Processing Equipment Located Within Protective Enclosures FPN: See NFPA 30A, Automotive and Marine Service Station Code, 1996 edition, Section 4-5.7	2	Within any protective enclosure housing vapor processing equipment.
Vapor Processing Equipment Not Within Protective Enclosures (excluding piping and combustion devices)	2	The space within 18 in. in all directions of equipment containing flammable vapor or liquid extending to grade level. Up to 18 in. above grade level within 10 ft horizontally of the vapor processing equipment.
Equipment Enclosures	1	Any space within the enclosure where vapor or liquid is present under normal operating conditions.
Vacuum-Assist Blowers [1,2,3,4]	2	The space within 18 in. in all directions extending to grade level. Up to 18 in. above grade level within 10 ft horizontally.

Note: For SI units, 1 in. = 2.5 cm; 1 ft -= 0.3048 m.
[1]Refer to Figure 514.2 for an illustration of classified location around dispensing devices.
[2]Ceiling mounted hose reel.
[3]FPN: See NFPA 30A, Automotive and Marine Service Station Code, 1996 edition, Section 2-2.
[4]FPN: Area classification inside the dispenser enclosure is covered in ANSI/UL 87-1995, Power-Operated Dispensing Devices for Petroleum Products.

(Log #3992)

14- 455 - (514): Accept in Principle
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Change to read:
Article 514 — ~~Gasoline Dispensing and Service Stations~~ Motor Fuel Dispensing Facility
514-1. This article shall apply to the electrical systems at Motor Fuel Dispensing Facilities as defined in Section 514-2.
514-2. Definitions. That portion of a property where motor fuels are stored and dispensed from fixed equipment into the fuel tanks of motor vehicles, self-propelled marine craft, or approved containers.
Other areas used as lubritoriums, service rooms, repair rooms, offices, salesrooms, compressor rooms, and similar locations shall comply with Articles 510 and 511 with respect to electric wiring and equipment.
Where the authority having jurisdiction can satisfactorily determine that flammable liquids having a flash point below 38°C (100°F), such as gasoline, will not be handled, such locations shall be required to be classified.
FPN No. 1: For further information regarding safeguards or gasoline dispensing and service stations, see NFPA 30A, Automotive and Marine Service Station Code, 1996, edition.
FPN No. 2: For information on classified areas pertaining to LP-Gas systems other than residential or commercial, see NFPA 58, Standard for the Storage and Handling of Liquefied Petroleum Gases, 1995 edition and NFPA 59, Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, 1995 edition.
FPN No. 3: See Section 555-10 for gasoline dispensing stations in marinas and boatyards.
SUBSTANTIATION: Changing the name of the Article and the definition will allow those using NFPA 30A to use common terms, see NFPA 30A-May 2000 ROP, Proposal 30A-8. Providing a scope will make Article 514 comply with Section 2.2.1 of NEC Style Manual.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: The action on Proposal 14-453 addresses this issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

(Log #3994)

14- 456 - (514): Accept in Principle
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise the entire Article 514 as follows:
Article 514 — Gasoline Dispensing and Service Stations
514.2. Definitions. A gasoline dispensing and service station is a location where gasoline or other volatile flammable liquids or liquefied flammable gases are transferred to the fuel tanks (including auxiliary fuel tanks) of self-propelled vehicles or approved containers.
Other areas used as lubritoriums, service rooms, repair rooms, offices, salesrooms, compressor rooms, and similar locations shall comply with Articles 510 and 511 with respect to electric wiring and equipment.
Where the authority having jurisdiction can satisfactorily determine that flammable liquids having a flash point below 38°C (100°F), such as gasoline, will not be handled, such locations shall be required to be classified.
FPN No. 1: For further information regarding safeguards for gasoline dispensing and service stations, see NFPA 30A, Automotive and Marine Service Station Code, 1996 edition.
FPN No. 2: For information on classified areas pertaining to LP-Gas systems other than residential or commercial, see NFPA 58, Standard for the Storage and Handling of Liquefied Petroleum Gases, 1995 edition and NFPA 59, Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, 1995 edition.
FPN No. 3: See Section 555.10 for gasoline dispensing stations in marinas and boatyards.
514.3. Classification of Locations.
x(a) Class I Locations. Table 514.2 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify service stations. A Class I location shall not extend beyond an unpierced wall, roof, or other solid partition.
FPN: For information on area classification where liquefied petroleum gases are dispensed, see NFPA 58, Standard for the Storage and Handling of Liquefied Petroleum Gases, 1995 edition.
Insert Existing Figure 514.2 Here
514.4. Wiring and Equipment in Class I Locations. All electrical equipment and wiring within Class I locations defined in Section 514.2 shall comply with the applicable provisions of Article 501.
Exception: As permitted in Section 514.8.
FPN: For special requirements for conductor insulation, see Section 501.13.
514.5. Wiring and Equipment Embedded, Underslab, or Underground. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit. Any portion of electrical wiring or equipment that is below the surface of a Class I, Division 1 or Division 2 location (as defined in Table 514.2) shall be considered to be in a Class I, Division 1

location, which shall extend at least to the point of emergence above grade. Refer to Table 300.5.

Exception No. 1: Type MI cable shall be permitted where it is installed in accordance with Article 330.

Exception No. 2: Rigid nonmetallic conduit complying with Article 347 shall be permitted where buried under not less than 2 ft (610 mm) of cover. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 2 ft (610 mm) of the underground run to emergence or to the point connection to the aboveground raceway, and an equipment grounding conductor shall be included to provide electrical continuity of the raceways system and for grounding on noncurrent-carrying metal parts.

514.6. Sealing.

(a) At Dispenser. An approved seal shall be provided in each conduit run entering or leaving a dispenser or any cavities of enclosures in direct communication therewith. The sealing fitting shall be the first fitting after the conduit emerges from the earth or concrete.

(b) At Boundary. Additional seals shall be provided in accordance with Section 501.5.

Sections 501.5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations.

514.7. Wiring and Equipment Not Within Class I Locations.

(a) Wiring and Equipment Above Class I Locations. Wiring and equipment above the Class I locations defined in Section 514.3 shall comply with Section 511.7.

514.8. Special Equipment.

(a) Circuit Disconnects.

(1) General. Each circuit leading to or through dispensing equipment, including equipment for remote pumping systems, shall be provided with a clearly identified and readily accessible switch or other acceptable means, located remote from the dispensing devices, to disconnect simultaneously from the source of supply, all conductors of the circuit, including the grounded conductor, if any.

Single-pole breakers utilizing handle ties shall not be permitted.

x(2) Attended Self-Service Stations. Emergency controls as specified in Section 514.5(a) shall be installed at a location acceptable to the authority having jurisdiction, but controls shall not be more than 100 ft (30 m) from dispensers.

x(3) Unattended Self-Service Stations. Emergency controls as specified in Section 514.5(a) shall be installed at a location acceptable to the authority having jurisdiction, but the controls shall be more than 20 ft (7 m) but less than 100 ft (30 m) from the dispensers. Additional emergency controls shall be installed on each group of dispensers or the outdoor equipment used to control the dispensers. Emergency controls shall shut off all power to all dispensing equipment at the station. Controls shall be manually reset only in a manner approved by the authority having jurisdiction.

FPN: For additional information, see 9-4.5 and 9-5.3 of NFPA 30A, Automotive and Marine Service Station Code, 1996 edition.

(b) Provisions for Maintenance and Service of Dispensing Equipment. Each dispensing device shall be provided with a means to remove all external voltage sources, including feedback, during periods of maintenance and service of the dispensing equipment.

514.16 Grounding. All metal raceways, the metal armor or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with Section 501.16.

SUBSTANTIATION: This proposal is the work of a Task Group including Donny Cook, Fred Walker, Gordon Johnson, Don Zipsi, Mark Goodman, Kevin Earley, Mark Ode, Bob Benedetti, and Richard Hild. The Task Group was not balloted. The purpose of this proposal is to provide parallel numbering from Article 511 through 516 to comply with Section 2.4.1 of the NEC Style Manual.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: The action on Proposal 14-454 addresses this issue.

COMMENT ON AFFIRMATIVE:

WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #1653)

14- 457 - (514-1): Reject

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI

RECOMMENDATION: Revise first paragraph to read as follows:

A gasoline dispensing and service station is a location where gasoline or other volatile flammable liquids or liquefied flammable gases are transferred to the fuel tanks (including auxiliary fuel tanks) of self-propelled vehicles or ~~approved~~ (identified) containers.

SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

PANEL ACTION: Reject.

PANEL STATEMENT: The proper term is approved, as defined in both NFPA 30 and NFPA 30A.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #3597)

14- 458 - (514-1): Reject

SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise the first paragraph to read as follows:

"A gasoline dispensing and service station is a location where gasoline or other volatile flammable liquids or liquefied flammable gases are transferred to the fuel tanks (including auxiliary fuel tanks) of self-propelled vehicles or ~~approved~~ (identified) containers."

SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

PANEL ACTION: Reject.

PANEL STATEMENT: The proper term is approved, as defined in both NFPA 30 and NFPA 30A.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #2910)

14- 459 - (514-2): Accept

SUBMITTER: Mark R. Hilbert, Wolfeboro, NH

RECOMMENDATION: Add a new sentence after the current first sentence. The new sentence would read: "Table 515-2 shall be used for the purpose of delineating and classifying aboveground tanks."

SUBSTANTIATION: With the ever growing popularity of aboveground tanks at state, municipal, and commercial fueling sites, I find myself with locations that meet the definition of "gasoline dispensing" and are subject to the rules of Article 514. However, there is no reference in Table 514-2 for aboveground tanks. This information is contained in Table 515-2 but is only relative, at this time, to bulk storage sites. In the 1999 NEC proposal cycle I submitted this proposal in the form of an asterisk note to be added to Table 514-2. The panel agreed that the proposal had merit but was unable to change the extracted material of Table 514-2. This new second sentence would serve the same purpose and would not be affected by the extract policy. The acceptance of this proposal would allow for proper classification of aboveground tanks without having to resort to NFPA 30. Use of NFPA 30 can be difficult in areas where it has not been legally adopted by the state or municipality.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #3981)

14- 460 - (514-2, Table 514-3): Accept

Note: The Technical Correlating Committee directs the Panel to add a Heading to 514-2(b) in accordance with the Style Manual. Staff was directed to add SI Units to the Table. This action will be considered by the Panel as Public Comment.

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Add new text to read as follows:

x514-2(a). Class I Locations. Table 514-2 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify service stations. A Class I location shall not extend beyond an unpierced wall, roof, or other solid partition.

x(b) Table 514.3 shall be used to delineate and classify areas where Compressed Natural Gas (CNG), Liquefied Natural Gas (LNG), or Liquefied Petroleum Gas (LPG) are stored, handled, or dispensed. Where compressed natural gas or liquefied natural gas dispensers are installed beneath a canopy or enclosure, either the canopy or enclosure shall be deigned to prevent accumulation or entrapment of ignitable vapors or all electrical equipment installed beneath the canopy or enclosure shall be suitable for Class I, Division 2 hazardous (classified) locations. Dispensing devices for liquefied petroleum gas shall be located not less than 5 ft from any dispensing device for Class I liquids.

FPN: For information on area classification where liquefied petroleum gases are dispensed, see NFPA 58, Standard for the Storage and Handling of Liquefied petroleum Gases, 1995 edition.

xTable 514.3. Electrical Equipment Classified Areas for Dispensing Devices

	Extent of Classified Area	
Dispensing Device	**Class I, Division 1**	**Class I, Division 2**
Compressed Natural Gas	Entire space within the dispenser enclosure	5 ft in all directions from dispenser enclosure
Liquefied Natural Gas	Entire space within the dispenser enclosure and 5 ft in all directions from the dispenser enclosure	From 5 ft to 10 ft in all directions from the dispenser enclosure
Liquefied Petroleum Gas	Entire space within the dispenser enclosure; 18 in. from the exterior surface of the dispenser enclosure to an elevation of 4 ft above the base of the dispenser; the entire pit or open space beneath the dispenser and within 20 ft horizontally from any edge of the dispenser when the pit or trench is not mechanically ventilated.	Up to 18 in. aboveground and within 20 ft horizontally from any edge of the dispenser enclosure, including pits or trenches within this area when provided with adequate mechanical ventilation.

SUBSTANTIATION: Providing the proposed information from NFPA 30A will provide NEC users guidelines for fuels other than gasoline that are used in vehicles.

PANEL ACTION: Accept.

NOT RETURNED: 2 Earley, Saban

COMMENT ON AFFIRMATIVE:

WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #2411)

14- 461 - (514-2 Note): Reject

SUBMITTER: William E. Bickner, Stillwater, MN

RECOMMENDATION: Revise the note to Table 514-2, as shown below:

Note: For SI units, 1 in. = 2.5 cm; 1 ft = 0.3~~048~~ m.

SUBSTANTIATION: For consistency. These values are both rounded to one decimal place in NFPA 30A, Table 7. Neither are rounded in Figure 514-2. Results are inconsistently and sometimes erroneously rounded in NFPA 30A (Sections 4-5.7, 9-5.3). Use of units (meters, centimeters, etc.) seems inconsistent in both standards. Rounding of results to a single decimal place is certainly reasonable, but conversion factors should not be rounded.

PANEL ACTION: Reject.

PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

(Log #2137)

14- 462 - (Table 514-2): Accept

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Revise Table 514-2 by adding an additional column to the immediate right of the center column titled "Group D Division". Title the new column "NEC Class I, Group IIA, Zone". The value to be placed in this column shall be as follows:

"All areas designated as "Unclassified" for Divisions would also be "Unclassified" for Zones. All areas designated as "2" for Divisions would also be "2" for Zones. "Undeground Tank Fill Opening", "Dispensing Device Pits", and "Vapor Processing Systems Pits" would be designated as Zone "0". All other locations designated as Division "1" shall be designated as Zone "1"."

The text in the "Extent of Classified Area" column should be revised as follows:

Replace each occurrence of "Division 1 or 2" with the words "Division 1, Division 2, Zone 1, or Zone 2".

The text in the "Extent of Classified Area" column should be revised as follows:

Replace each occurrence of "Division" with the words "Division 1, or Zone 1".

SUBSTANTIATION: This proposal is to recognize the alternate method for classification that was introduced into the 1996 National Electrical Code. NEC Article 505 Group IIA group designation is equivalent to NEC Article 500 Group D designation. The primary intent for proposing this change was to maintain correlation between the recommendations of NFPA 30A and other industry standards related to electrical area classification. While the fuel dispensing segment of the industry may not foresee immediate applications of zone classification, it is important that the various standards developing groups maintain consistent and coordinated recommendations. During the proposal and approval process for the 1996 National Electrical Code, extensive substantiation was provided to demonstrate that the zone method of classification provided equal if not higher levels of safety as compared to the division method, we were historically more familiar with. Following the approval of Article 505 in the NEC, NFPA, API, ISA, and UL began extensive efforts to develop new standards and revise existing standards to provide consistency and correlation between the recommendations and requirements of the various standards developing organizations. At the same time there was also an extensive effort to provide consistency and correlation with other world standards such as the IEC 79 series of standards and the International Petroleum Code 15.

This proposal is needed to maintain this consistency and correlation between NFPA 30A and other standards such as the NEC, API RP 500, API RP 505, and ISA SP 12.24. As the various North American standards related to zone classification were developed, there was a deliberate effort to maintain consistency in definitions. Therefore, the zone classification definitions used in all the NFPA, API, ISA, and UL zone related standards are the same as those of the NEC. While the exact wording describing a Class I, Division 2 location in NEC Article 501 is not word for word exactly the same as the description of a Class I, Zone 2 as described in NEC Article 505, the two areas are the same. This was the logic

used in this proposal for recommending that all existing Class I Division 2 locations also be identified as Class I Zone 2 locations. The logic for the proposed correlation between the NFPA 30A Class I Division 1 locations and Class I Zone 0 or zone 1 locations is not quite as straight forward, but are also based on the NEC Articles 501 and 505 description of these areas. While an argument could be made that by dividing existing Division 1 locations into the two categories of either Zone 0 where volatile materials are present continuously or Zone 1 where volatile materials could be present under normal situations affords a higher level of safety for fuel dispensing locations, it must also be recognized that for the most part fuel dispensing equipment like most other petroleum facility equipment does not have volatile materials present continuously. Therefore, in general the strict correlation between the existing Division 1 locations would be that they are equivalent to Zone 1 locations. However, this proposal recommends a slightly more conservative approach than a straight correlation of Division 1 to Zone 1. For "Underground Tank Fill Opening", "Dispensing Device Pits", and "Vapor Processing Systems Pits" where there is possibly a higher than normal risk that volatile materials could be present under normal operation, a more conservative recommendation that these Division 1 locations be classified as Zone 0. For all other Division 1 locations where the risk of volatile materials being present under normal operation is much lower, the less conservative correlation of Division 1 to Zone 1 was proposed.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

(Log #1160)

14- 464 - (514-4, Exception (New)): Reject
SUBMITTER: Charles K. Eldridge, Indianapolis, IN
RECOMMENDATION: Add a new Exception to read:
Wiring and equipment above the Class I locations defined in Section 514-2 shall comply with Sections 511-6 and 511-7.
Exception: Overhead outdoor wiring over 12 ft above the limits of the Class I location.
SUBSTANTIATION: Outdoor wiring installed in accordance with Article 225 may be installed next to a gasoline-dispensing unit where the Class I, Division 2 area extends under the overhead cable. This should not be a violation; however, the wiring is above a Class I area and the requirements of Sections 511-6 and 511-7 are required to be followed. Those references are for indoor wiring so they should not apply. Additionally, the overhead cable is nonsparking as opposed to the spark producing equipment and lighting referenced in 511-7 where the required is 12 ft.
PANEL ACTION: Reject.
PANEL STATEMENT: Wiring over a Class I area needs to be mechanically protected.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
OMEARA: This proposal should be accepted. I agree with the submitter's substantiation and feel the overhead cable is not a source of ignition. Also, I feel the panel did not offer sufficient technical substantiation for their rejection.

(Log #409)

14- 465 - (514-5(a)): Reject
SUBMITTER: Kevin O'Connell, Primex Technologies
RECOMMENDATION: Revise 514-5(a) to read as follows:
(a) General. Each circuit leading to or through dispensing equipment, including equipment for remote pumping systems, shall be provided with a clearly identified means, located remote from the dispensing devices, to disconnect simultaneously from the source of supply, all conductors of the circuit, ~~including the grounded conductor, if any~~
Single-pole breakers utilizing handle ties shall not be permitted.
SUBSTANTIATION: Since the tanks and pumps at a service station are grounded at their location, once the ground from the supplied service is disconnected, the effect would cause a separately derived ground scenario. Maintenance personnel using any electrically run equipment could run the risk of developing a static discharge next to Class 1 rated material/fumes. Submergible pumps would be the biggest hazard, but above ground tanks should also be considered.
Experience is the result of handling explosives, and DOD regulations requiring personnel to be grounded whenever handling or working around explosive dusts or fumes, to eliminate static discharge.
DOD Contractors Safety Manual Chapter 12 — Safety Requirements for Explosives Facilities -
DOD document #4145.26-M.
PANEL ACTION: Reject.
PANEL STATEMENT: This information should be retained. The grounded conductor referred to here is not the equipment grounding conductor.

(Log #2756)

14- 466 - (514-5(a)): Reject
SUBMITTER: John Vinciguerra, Aron Electric, Inc.
RECOMMENDATION: There needs to be a shunt trip involved and a maintained push button, the source to activate the shunt trip needs to be in the same panel as the shunt trip breaker.
SUBSTANTIATION: Most inspectors require a shunt trip, whether or not a relay is used to shut down power. This reasoning is so the emergency stop is not reactivated by accident. This shunt trip has to be reset making it two (2) steps to regain power.
1. Turn on or pull out stop button.
2. Reset shunt trip.

Also this needs to be in the same panel as the petroleum equipment. This is the most important matter. For some reason the power going to the shunt trip portion of the breaker is getting turned off. No matter how it is labeled there are some people who don't understand the significance of this breaker and turn it off. To give you an example, Florida Department of Transportation in Orlando called me to fix the E-stop, their electricians could not figure out why their shunt trip would not work. I found that in one of the large main panels a breaker that fed the shunt trip portion of the breaker to the gas equipment had been turned off. We are also noticing from time to time this is happening at service stations.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter does not suggest any proposed text, which fails to meet the requirements for submitting a proposal.

(Log #308)

14- 467 - (514-6): Reject
SUBMITTER: Ronald Fuller, Washington State Labor and Industries
RECOMMENDATION: Revise 514-6 to read as follows:
...Each dispensing device shall be provided with a separate and individual means to remove all external voltage sources, including feedback, during periods of maintenance and service of ~~the~~ each dispensing equipment.
SUBSTANTIATION: The new language as written in the 1999 National Electrical code addresses the circuit disconnecting means of dispensing equipment for servicing. As currently written, there are no additional requirements to those already required by NEC 514-5(a), (b), (c). To allow for safe conditions when servicing, a "separate and individual" means must be provided to disconnect "each" individual dispensing equipment.
As currently written, a multi-pole switching device is allowed to be installed between the branch circuit panel and the installation of multiple dispensers provided that all circuit conductors (grounded and ungrounded) to those dispensers as required by NEC 514-6 are disconnected.
In order to not interrupt service to dispensers not being serviced, a service person would likely disconnect only the dispensing device to be serviced at the branch circuit panel (possibly a device that interrupts only the ungrounded conductor as allowable by NEC 514-5, 6) rather than utilizing the multi-pole switching device. To use the multi-switch in this situation would disconnect all dispensers controlled by that multi-pole device and possibly shutdown an entire facility.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing language provides for more than one method to satisfy this requirement. Accepting this proposal would eliminate this flexibility.

NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: I disagree with the Panel Action and Statement. It does not seem consistent with actions on similiar porposals.

(Log #3598)

14- 469 - (514-7(a)): Reject
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
"An ~~approved~~ (identified) seal shall be provided in each conduit run entering or leaving a dispenser or any cavities or enclosures in direct communication therewith."
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: See Proposal 14-468
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative Vote on Proposal 14-468.

(Log #2138)

14- 470 - (514-8): Accept
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Revise text to read as follows:
"Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit. Any portion of electrical wiring or equipment that is below the surface of a Class I, Division 1, ~~or~~ Division 2, Zone 1, or Zone 2 locations (as defined in Table 514-2) shall be considered to be in a Class I, Division 1 or Zone 1 location, which shall extend at least to the point of emergence above grade. Refer to Table 300-5.
SUBSTANTIATION: This proposal is to recognize the alternate method for classification that was introduced into the 1996 National Electrical Code. NEC Article 505 Group IIA group designation is equivalent to NEC Article 500 Group D designation. The primary intent for proposing this change was to maintain correlation between the recommendations of NFPA 30A and other industry standards related to electrical area classification. While the fuel dispensing segment of the industry may not foresee immediate applications of zone classification, it is important that the various standards developing groups maintain consistent and coordinated recommendations. During the proposal and approval process for the 1996 National Electrical Code, extensive substantiation was provided to demonstrate that the zone method of classification provided equal if not higher levels of safety as compared to the division method, we were historically more familiar with. Following the approval of Article 505 in the NEC, NFPA, API, ISA, and UL began extensive efforts to develop new standards and revise existing standards to provide consistency and correlation between the recommendations and requirements of the various standards developing organizations. At the same time there was also an extensive effort to provide consistency and correlation with other world standards such as the IEC 79 series of standards and the International Petroleum Code 15.
This proposal is needed to maintain this consistency and correlation between NFPA 30A and other standards such as the NEC, API RP 500, API RP 505, and ISA SP 12.24. As the various North American standards related to zone classification were developed, there was a deliberate effort to maintain consistency in definitions. Therefore, the zone classification definitions used in all the NFPA, API, ISA, and UL zone related standards are the same as those of the NEC. While the exact wording describing a Class I, Division 2 location in NEC Article 501 is not word for word exactly the same as the description of a Class I, Zone 2 as described in NEC Article 505, the two areas are the same. This was the logic used in this proposal for recommending that all existing Class I Division 2 locations also be identified as Class I Zone 2 locations. The logic for the proposed correlation between the NFPA 30A Class I Division 1 locations and Class I Zone 0 or zone 1 locations is not quite as straight forward, but are also based on the NEC Articles 501 and 505 description of these areas. While an argument

could be made that by dividing existing Division 1 locations into the two categories of either Zone 0 where volatile materials are present continuously or Zone 1 where volatile materials could be present under normal situations affords a higher level of safety for fuel dispensing locations, it must also be recognized that for the most part fuel dispensing equipment like most other petroleum facility equipment does not have volatile materials present continuously. Therefore, in general the strict correlation between the existing Division 1 locations would be that they are equivalent to Zone 1 locations. However, this proposal recommends a slightly more conservative approach than a straight correlation of Division 1 to Zone 1. For "Underground Tank Fill Opening", "Dispensing Device Pits", and "Vapor Processing Systems Pits" where there is possibly a higher than normal risk that volatile materials could be present under normal operation, a more conservative recommendation that these Division 1 locations be classified as Zone 0. For all other Division 1 locations where the risk of volatile materials being present under normal operation is much lower, the less conservative correlation of Division 1 to Zone 1 was proposed.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative Vote on Proposal 14-376a.

(Log #3979)

14- 471 - (514-8): Reject
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise text to read as follows:
514-8. Underground Wiring. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit. Any ~~portion of electrical wiring or equipment~~ conduit that is below the surface of a Class I, Division 1 or Division 2 location (as defined in Table 514-2) shall be ~~considered to be in a Class I, Division 1 location, which shall extend at least to the point of emergence above grade~~. sealed with a listed seal when it emerges from below grade. Refer to Table 300-5.
SUBSTANTIATION: To provide common wording for conduit systems installed below grade from Articles 511 through 516.
PANEL ACTION: Reject.
PANEL STATEMENT: The suggested wording would conflict with the intent of the original language.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative Vote on Proposal 14-394.

(Log #4241)

14- 472 - (514-8): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Delete the ending phrase "which shall extend at least to the point of emergence above grade."
SUBSTANTIATION: The only reason this is in the Code is to prevent a necessity for handholes out in the pavement in the event a classification boundary falls more than one conduit length from the point of emergence from grade, since Section 501-5(c)(1) requires seals to be accessible. The better solution is to put generic language in the sealing rules in Article 501 allowing for seals to be placed at the point of emergence. This proposal is a companion proposal to another that does just that.
PANEL ACTION: Reject.
PANEL STATEMENT: See Proposal 14-471.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Earley, Saban
EXPLANATION OF NEGATIVE:
COOK: The proposal, like Proposal 14-471, indicates that there may be a different way of covering underground wiring and the seals associated with that wiring for the special occupancies. I do not agree that the Panel Action should be to do nothing.

ARTICLE 515 — BULK STORAGE PLANTS

(Log #1267)

14- 473 - (515): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: In **Table 515-2**, change the text in the last column of the table as shown below: (Note: There are 53 places where SI dimensions are added.)
Space within ~~5 ft~~ 1.5 m (5 ft) of any edge of such equipment, extending in all directions.
Space between ~~5 ft~~ 1.5 m (5 ft) and ~~8 ft~~ 2.5 m (8 ft) of any edge of such equipment, extending in all directions. Also, space up to ~~3 ft~~ 900 mm (3 ft) above floor or grade level within ~~5 ft~~ 1.5 m (5 ft) to ~~25 ft~~ 7.5 m (25 ft) horizontally from any edge of such equipment. 1
Space within ~~3 ft~~ 900 mm (3 ft) of any edge of such equipment, extending in all directions.
Space between ~~3 ft~~ 900 mm (3 ft) and ~~8 ft~~ 2.5 m (8 ft) of any edge of such equipment, extending in all directions. Also, space up to ~~3 ft~~ 900 mm (3 ft) above floor or grade level within ~~3 ft~~ 900 mm (3 ft) to ~~10 ft~~ 3.0 m (10 ft) horizontally from any edge of such equipment.
Space inside dike where dike height is greater than the distance from the tank to the dike for more than 50 percent of the tank circumference.
Within ~~10 ft~~ 3.0 m (10 ft) from shell, ends, or roof of tank. Space inside dikes to level of top of dike.
Within ~~5 ft~~ 1.5 m (5 ft) of open end of vent, extending in all directions.
Space between ~~5 ft~~ 1.5 m (5 ft) and ~~10 ft~~ 3.0 m (10 ft) from open end of vent, extending in all directions.
Space above the roof and within the shell.
Any pit, box, or space below grade level, if any part is within a Division 1 or 2 classified location.
Up to ~~18 in.~~ 450 mm (18 in.) above grade level within a horizontal radius of ~~10 ft~~ 3.0 m (10 ft) from a loose fill connection, and within a horizontal radius of ~~5 ft~~ 1.5 m (5 ft) from a tight fill connection.

Within ~~3 ft~~ 900 mm (3 ft) of open end of vent, extending in all directions.
Space between ~~3 ft~~ 900 mm (3 ft) and ~~5 ft~~ 1.5 m (5 ft) of open end of vent, extending in all directions.
Within ~~3 ft~~ 900 mm (3 ft) of vent and fill openings, extending in all directions.
Space between ~~3 ft~~ 900 mm (3 ft) and ~~5 ft~~ 1.5 m (5 ft) from vent or fill opening, extending in all directions. Also, up to ~~18 in.~~ 450 mm (18 in.) above floor or grade level within a horizontal radius of ~~10 ft~~ 3.0 m (10 ft) from vent or fill openings.
Within ~~5 ft~~ 1.5 m (5 ft) of any edge of such devices, extending in all directions. Also up to ~~3 ft~~ 900 mm (3 ft) above floor or grade level within ~~25 ft~~ 7.5 m (25 ft) horizontally from any edge of such devices.
Within ~~3 ft~~ 900 mm (3 ft) of any edge of such devices, extending in all directions. Also up to ~~18 in.~~ 450 mm (18 in.) above grade level within ~~10 ft~~ 3.0 m (10 ft) horizontally from any edge of such devices.
Entire space within pit if any part is within a Division 1 or 2 classified location.
Entire space within pit if any part is within a Division 1 or 2 classified location.
Entire pit.
Space up to ~~18 in.~~ 450 mm (18 in.) above ditch, separator, or basin. Also up to ~~18 in.~~ 450 mm (18 in.) above grade within ~~15 ft~~ 4.5 m (15 ft) horizontally from any edge.
Same as pits.
Within ~~3 ft~~ 900 mm (3 ft) of edge of dome, extending in all directions.
Space between ~~3 ft~~ 900 mm (3 ft) and ~~15 ft~~ 4.5 m (15 ft) from edge of dome, extending in all directions.
Within ~~3 ft~~ 900 mm (3 ft) of point of venting to atmosphere, extending in all directions.

Space between ~~3 ft~~ 900 mm (3 ft) and ~~15 ft~~ 4.5 m (15 ft) from point of venting to atmosphere, extending in all directions. Also up to ~~18 in.~~ 450 mm (18 in.) above grade within a horizontal radius of ~~10 ft~~ 3.0 m (10 ft) from point of loading connection.

If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.

Within ~~3 ft~~ 900 mm (3 ft) of open end of vent, extending in all directions.

Space between ~~3 ft~~ 900 mm (3 ft) and ~~15 ft~~ 4.5 m (15 ft) from open end of vent, extending in all directions. Also within ~~3 ft~~ 900 mm (3 ft) of edge of dome, extending in all directions.

Within ~~3 ft~~ 900 mm (3 ft) of point of connection of both fill and vapor lines, extending in all directions.

Within ~~3 ft~~ 900 mm (3 ft) of point of connections, extending in all directions. Also up to ~~18 in.~~ 450 mm (18 in.) above grade within a horizontal radius of ~~10 ft~~ 3.0 m (10 ft) from point of connections.

All pits or spaces below floor level.

Space up to ~~18 in.~~ 450 mm (18 in.) above floor or grade level for entire storage or repair garage.

If there is any opening to these rooms within the extent of an outdoor classified location, the entire room shall be classified the same as the space classification at the point of the opening.

If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.

See Figure 515-2.

In **Table 515-2**, delete "For SI units, 1 in. = 2.5 cm; 1 ft = 0.3048 m." at the bottom of the table.

In **Figure 515-2**, change "2 ft" to "600 mm (2 ft)" in one place; "25 ft" to "7.6 m (25 ft)" in four places; and "50 ft" to "15 m (50 ft)" in three places.

In **Figure 515-2 Note 2**, change "25 ft (7.6 m)" to "7.6 m (25 ft)" in two places, sub-notes "a" and "b".

In **Figure 515-2**, delete "For SI units: 1 ft = 0.3048 m." at the bottom of the figure.

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Reject.

PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9

NEGATIVE: 3

NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

KUCZKA: See my Explanation of Negative Vote on Proposal 14-10.

OMEARA: This proposal should be accepted, to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.

ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #3976)

14- 474 - (515): Accept in Principle

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 14-477, 14-478, 14-480, 14-481, 14-482, and 14-484. The Technical Correlating Committee directs NFPA staff to add the SI units to Table 515-2. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Revise the entire Article 515 as follows:

Article 515 — Bulk Storage Plants

515.1. Scope. This article covers a property or portion of a property where flammable liquids are received by tank vessel, pipelines, tank car, or tank vehicle, and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car, tank vehicle, portable tank, or container.

515.2. Definition. Bulk Storage Plant. That portion of a property where flammable liquids are received by tank vessel, pipelines, tank car, or tank vehicle, and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipelines, tank car, tank vehicle, portable tank, or container.

FPN: For further information, see NFPA 30, Flammable and Combustible Liquids Code, 1996 edition.

x515.3. Class I Locations. Table 515.2 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify bulk storage plants. The Class location shall not extend beyond a floor, wall, roof, or other solid partition that has no communicating openings.

FPN: The area classifications listed in Table 515.2 are based on the premise that the installation meets the applicable requirements of NFPA 30, Flammable and Combustible Liquids Code, 1996, Chapter 5, in all respects. Should this not be the case, the authority having jurisdiction has the authority to classify the extent of the classified space.

FPN No. 3: See Section 555.10 for gasoline dispensing stations in marinas and boatyards.

xFigure 515.3. Marine terminal handling flammable liquids.

515.4. Wiring and Equipment Located in Class I Locations. All electrical wiring and equipment within the Class I locations defined in Section 515.2 shall comply with the applicable provisions of Article 501.

Exception: As permitted in Section 515.5.

515.7. Wiring and Equipment Above Class I Locations.

(a) Fixed Wiring. All fixed wiring above Class I locations shall be in metal raceways or PVC Schedule 80 rigid nonmetallic conduit, or equivalent, or be Type MI, TC, or MC cable.

(b) Fixed Equipment. Fixed equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

(c) Portable Lamps or Other Utilization Equipment. Portable lamps or other utilization equipment and their flexible cords shall comply with the provisions of Article 501 for the class of location above which they are connected or used.

515.8. Underground Wiring.

(a) Wiring Method. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit or, where buried under not less than 2 ft (610 mm) of cover, shall be permitted in rigid nonmetallic conduit or an approved cable. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 2 ft (610 mm) of the conduit run to emergence or to the point of connection to the aboveground raceway. Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal conduit from the point of lowest buried cable level to the point of connection to the aboveground raceway.

(b) Insulation. Conductor insulation shall comply with Section 501.13.

(c) Nonmetallic Wiring. Where rigid nonmetallic conduit or cable with a nonmetallic sheath is used, an equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.

515.9. Special Equipment — Gasoline Dispensers. Where gasoline or other volatile flammable liquids or liquefied flammable gases are dispensed at bulk stations, the applicable provisions of Article 514 shall apply.

515.10. Sealing. Sealing requirements in Sections 501.5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Buried raceways under defined Class I locations shall be considered to be within a Class I, Division 1 location.

515.16. Grounding. All metal raceways, the metal armor or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with Section 501.16.

FPN: For information on grounding for static protection, see 5-6.3.4 and 5-6.3.5 of NFPA 30, Flammable and Combustible Code, 1996 edition.

xTable 515.2. Class I Locations — Bulk Plants

Location	Class I, Division	Extent of Classified Location [1]
Indoor equipment installed in accordance with NFPA 30, Flammable Combustible Liquids Code, 1996, Section 5-3.4.5, where flammable vapor-air mixtures may exist under normal operation	1	Space within 5 ft of any edge of such equipment, extending in all directions.
	2	Space between 5 ft and 8 ft of any edge of such equipment, extending in all directions. Also, space up to 3 ft above floor or grade level within 5 ft to 25 ft horizontally from any edge of such equipment.[1]
Outdoor equipment of the type covered in NFPA 30, Flammable and Combustible Liquids Code, Section 5-3.4.5, where flammable vapor-air mixtures may exist under normal operation	1	Space within 3 ft of any edge of such equipment, extending in all directions.
	2	Space between 3 ft and 8 ft of any edge of such equipment, extending in all directions. Also, space up to 3 ft above floor or grade level within 3 ft to 10 ft horizontally from any edge of such equipment.
Tank — Aboveground[2]	1	Space inside dike where dike height is greater than the distance from the tank to the dike for more than 50 percent of the tank circumference.
Shell, Ends, or Roof and Dike Space Vent	2	Within 10 ft from shell, ends, or roof of tank. Space inside dikes to level of top of dike.
Vent	1	Within 5 ft of open end of vent, extending in all directions.
	2	Space between 5 ft and 10 ft from open end of vent, extending in all directions.
Floating Roof	1	Space above the roof and within the shell.
Underground Tank Fill Opening	1	Any pit, box, or space below grade level, if any part is within a Division 1 or 2 classified location.
	2	Up to 18 in. above grade level within a horizontal radius of 10 ft for loose fill connection, and within a horizontal radius of 5 ft from a tight fill connection.
Vent — Discharging Upward	1	Within 3 ft of open end of vent, extending in all directions.
	2	Space between 3 ft and 5 ft of open end of vent, extending in all directions.
Drum and Container Filling		
Outdoors, or Indoors with Adequate Ventilation	1	Within 3 ft of vent and fill openings, extending in all directions.
	2	Space between 3 ft and 5 ft from vent or fill opening, extending in all directions. Also, up to 18 in. above floor or grade level within a horizontal radius of 10 ft from vent or fill openings.
Pumps, Bleeders, Withdrawal Fittings, Meters, and Similar Devices		
Indoors	2	Within 5 ft of any edge of such devices, extending in all directions. Also up to 3 ft above floor or grade level within 25 ft horizontally from any edge of such devices.
Outdoors	2	Within 3 ft of any edge of such devices, extending in all directions. Also up to 18 in. above grade level within 10 ft horizon from any edge of such devices
Pits		
Without Mechanical Ventilation	1	Entire space within pit if any part is within a Division 1 or 2 classified location.
With Adequate Mechanical Ventilation	2	Entire space within pit if any part is within a Division 1 or 2 classified location.
Containing Valves, Fittings, or Piping, and Not Within A division 1 or 2 Classified Location	2	Entire pit.
Drainage Ditches, Separators, Impounding Basins		
Outdoor	2	Space up to 18 in. above ditch, separator, or basin. Also up to 18 in. above grade within 15 ft horizontally from any edge.
Indoor		Same as pits.
Tank Vehicle and Tank Car[3]		
Loading Through Open Dome	1	Within 3 ft of edge of dome, extending in all directions.
	2	Space between 3 ft and 15 ft from edge of dome, extending in all directions.
Loading through Bottom Connections with Atmospheric Venting	1	Within 3 ft of point of venting to atmosphere, extending in all directions.
	2	Space between 3 ft and 15 ft from point of venting to atmosphere, extending in all directions. Also up to 18 in. above grade within a horizontal radius of 10 ft from point of loading connection.
Office and Rest Rooms	Unclassified	If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.

xTable 515.2. Class I Locations — Bulk Plants (continued)

Location	Class I, Division	Extent of Classified Location [1]
Loading through Closed Dome with Atmospheric Venting	1	Within 3 ft of open end of vent, extending in all directions.
	2	Space between 3 ft and 15 ft from open end of vent, extending in all directions. Also within 3 ft of edge of dome, extending in all directions.
Loading through Closed Dome with Vapor Control	2	Within 3 ft of point of connection of both fill and vapor lines, extending in all directions.
Bottom Loading with Vapor Control Any Bottom Unloading	2	Within 3 ft of point of connections, extending in all directions. Also up to 18 in. above grade within a horizontal radius of 10 ft from point of connections.
Storage and Repair Garage for Tank Vehicles	1	All pits or spaces below floor level.
	2	Space up to 18 in. above floor or grade level for entire storage or repair garage.
Garages for other than Tank Vehicles	Unclassified	If there is any opening to these rooms within the extent of an outdoor classified location, the entire room shall be classified the same as the space classification at the point of the opening.
Indoor Warehousing Where There is No Flammable Liquid Transfer	Unclassified	If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.
Piers and Wharves		See Figure 515.2

Note: For SI units, 1 in. = 25.4 mm; 1 ft -= 0.3048 m.
[1]The release of Class I liquids may generate vapors to the extent that the entire building, and possible a zone surrounding it, should be considered a Class I, Division 2 location.
[2]For Tanks — Underground, see Section 514.2.
[3]When classifying extent of space, consideration shall be given to the fact that tank cars or tank vehicles may be spotted at varying points. Therefore, the extremities of the loading or unloading positions shall be used.

SUBSTANTIATION: 1. Created a new Section 515-1 Scope for the article to be consistent with the NEC Style Manual.
2. Changed old Section 515-1 on definitions to new Section 515.2 for definitions to be consistent with the NEC Style Manual.
3. Changed old Section 515-2, Table 515-2, and Figure 515-2 for area classifications to new Section 515.3, Table 515.3, and Figure 515.3 for consistency with the other specific hazardous locations articles.
4. Changed old Section 515-3 covering Wiring and Equipment Within Class I Locations to new Section 515.4, covering Wiring and Equipment Located in Class I Locations. Changed the word "Within" in the title and the text to "located in" to be consistent throughout the Articles.
5. Old Section 515.5 for underground wiring has been changed to new Section 515.8 for underground wiring for consistency with the other specific hazardous location articles.
6. Old Section 515-7 for dispensing equipment has been renumbered to new Section 515.9 and the title has been changed to "Special Equipment — Gasoline Dispensers" to provide consistency.
7. Old Section 515-6 covering sealing has been changed to new Section 515.10 for consistency between articles.
PANEL ACTION: Accept in Principle.
Accept the proposed text, but renumber 515-9 to 515-10 and renumber 515-10 to 515-9.
PANEL STATEMENT: The minor changes implement a standardized numbering format for Articles 511 through 516.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #3995)

14- 475 - (515): Accept in Principle
SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL
RECOMMENDATION: Revise the entire Article 515 as follows:
Article 515 — Bulk Storage Plant.
515.2. Definition. A bulk storage plant is that portion of a property where flammable liquids are received by tank vessel, pipelines, tank car, or tank vehicle, and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car, tank vehicle, portable tank, or container.

FPN: For further information, see NFPA 30, Flammable and Combustible Liquids Code, 1996 edition.
x515.3. Classification I Locations. Table 515.2 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify bulk storage plants. The Class I location shall not extend beyond a floor, wall, roof, or other solid partition that has no communicating openings.
Insert Existing Table 515.2 Here
515.4. Wiring and Equipment in Class I Locations. All electric wiring and equipment within Class I locations defined in Section 515.3 shall comply with the applicable provisions of Article 501.
Exception: As permitted in Section 515.5.
FPN: Fr special requirements for conductor insulation, see Section 501.13.
515.5. Wiring and Equipment Embedded, Underslab, or Underground.
(a) Wiring Method. Underground wiring shall be installed in threaded rigid metal conduit or threaded steel intermediate metal conduit, or where buried under not less than 2 ft (610 mm) of cover, shall be permitted in rigid nonmetallic conduit or an approved cable. Where rigid nonmetallic conduit is used, threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 2 ft (610 mm) of the conduit run to emergence or the point of connection to the aboveground raceway. Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal from the point of lowest buried cable level to the point of connection to the aboveground raceway.
(b) Insulation. Conductor insulation shall comply with Section 501.13.
(c) Nonmetallic Wiring. Where rigid nonmetallic conduit or cable with a nonmetallic sheath is used, an equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of noncurrent-carrying metal parts.
515.6. Sealing. Sealing requirements in Sections 501.5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Buried raceways under defined Class I locations shall be considered to be within a Class I, Division 1 location.
515.7. Wiring and Equipment Not Within Class I Locations.
Wiring and Equipment Above Class I Locations. All fixed wiring above Class I locations shall be in metal raceways or PVC Schedule 80 rigid nonmetallic conduit, or equivalent, or be Type MI, TC, or MC cable. Fixed equipment that may produce arc, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment

having make-and-break or sliding contacts, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles. Portable lamps or other utilization equipment and their flexible cords shall comply with the provisions of Article 501 for the class of location above which they are connected or used.

515-6. Sealing. Sealing requirements in Section 501-5(a)(4) and (b)(2) shall apply to horizontal as well as to vertical boundaries of the defined Class I locations. Buried raceways under defined Class 1 locations shall be considered to be within a Class I, Division 1 location.

515.8. Special Equipment.

(a) Gasoline Dispensing. Where gasoline or other volatile flammable liquids or liquefied flammable gases are dispensed at bulk stations, the applicable provisions of Article 514 shall apply.

515.16. Grounding. All metal raceways, the metal armor or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with Section 501.16.

FPN: For information on grounding for static protection, see 5-6.3.4 and 5-6.3.5 of NFPA 30, Flammable and Combustible Code, 1996 edition.

SUBSTANTIATION: This proposal is the work of a Task Group including Donny Cook, Fred Walker, Gordon Johnson, Don Zipsi, Mark Goodman, Kevin Earley, Mark Ode, Bob Benedetti, and Richard Hild. The Task Group was not balloted. The purpose of this proposal is to provide parallel numbering from Article 511 through 516 to comply with Section 2.4.1 of the NEC Style Manual.

PANEL ACTION: Accept in Principle.
See Proposal 14-474.

PANEL STATEMENT: This proposal is identical to Proposal 14-474.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

NOT RETURNED: 2 Earley, Saban

COMMENT ON AFFIRMATIVE:
WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #923)

14- 476 - (515-2): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise last sentence to read as follows:

The Class 1 location shall not extend beyond a floor, wall, roof, or other ~~solid~~ partition that has no communicating openings, except as provided in Section 515-6 for underground wiring.

SUBSTANTIATION: Editorial. Deletion of "solid" does not change intent but removes any inference that stud walls, joist-type ceilings, and floors, and concrete and tile block walls which are not "solid" are not permitted. The reference to Section 515-6 removes any perceived conflict.

PANEL ACTION: Reject.

PANEL STATEMENT: The Panel does not see a conflict.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #2139)

14- 477 - (Table 515-2): Accept in Principle

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Revise Table 515-2 by adding an additional column to the immediate right of the center column titled "Group D Division". Title the new column "NEC Class I, Group IIA, Zone". The value to be placed in this column shall be as follows:

"All areas designated as "Unclassified" for Divisions would also be "Unclassified" for Zones. All areas designated as "2" for Divisions would also be "2" for Zones. The Division 1 areas related to "Underground Tank Fill Opening", and "Pits would be designated as Zone "0". All other locations designated as Division "1" shall be designated as Zone "1"."

The text in the "Extent of Classified Area" column should be revised as follows:

Replace each occurrence of "Division 1 or 2" with the words "Division 1, Division 2, Zone 1, or Zone 2"."

The text in the "Extent of Classified Area" column should be revised as follows:

Replace each occurrence of "Division" with the words "Division 1, or Zone 1".

SUBSTANTIATION: This proposal is to recognize the alternate method for classification that was introduced into the 1996 National Electrical Code. NEC Article 505 Group IIA group designation is equivalent to NEC Article 500 Group D designation. The primary intent for proposing this change was to maintain correlation between the recommendations of NFPA 30A and other industry standards related to electrical area classification. While the fuel dispensing segment of the industry may not foresee immediate applications of zone classification, it is important that the various standards developing groups maintain consistent and coordinated recommendations. During the proposal and approval process for the 1996 National Electrical Code, extensive substantiation was provided to demonstrate that the zone method of classification provided equal if not higher levels of safety as compared to the division method, we were historically more familiar with. Following the approval of Article 505 in the NEC, NFPA, API, ISA, and UL began extensive efforts to develop new standards and revise existing standards to provide consistency and correlation between the recommendations and requirements of the various standards developing organizations. At the same time there was also an extensive effort to provide consistency and correlation with other world standards such as the IEC 79 series of standards and the International Petroleum Code 15.

This proposal is needed to maintain this consistency and correlation between NFPA 30A and other standards such as the NEC, API RP 500, API RP 505, and ISA SP 12.24. As the various North American standards related to zone classification were developed, there was a deliberate effort to maintain consistency in definitions. Therefore, the zone classification definitions used in all the NFPA, API, ISA, and UL zone related standards are the same as those of the NEC. While the exact wording describing a Class I, Division 2 location in NEC Article 501 is not word for word exactly the same as the description of a Class I, Zone 2 as described in NEC Article 505, the two areas are the same. This was the logic used in this proposal for recommending that all existing Class I Division 2 locations also be identified as Class I Zone 2 locations. The logic for the proposed correlation between the NFPA 30A Class I Division 1 locations and Class I Zone 0 or zone 1 locations is not quite as straight forward, but are also based on the NEC Articles 501 and 505 description of these areas. While an argument could be made that by dividing existing Division 1 locations into the two categories of either Zone 0 where volatile materials are present continuously or Zone 1 where volatile materials could be present under normal situations affords a higher level of safety for fuel dispensing locations, it must also be recognized that for the most part fuel dispensing equipment like most other petroleum facility equipment does not have volatile materials present continuously. Therefore, in general the strict correlation between the existing Division 1 locations would be that they are equivalent to Zone 1 locations. However, this proposal recommends a slightly more conservative approach than a straight correlation of Division 1 to Zone 1. For "Underground Tank Fill Opening", "Dispensing Device Pits", and "Vapor Processing Systems Pits" where there is possibly a higher than normal risk that volatile materials could be present under normal operation, a more conservative recommendation that these Division 1 locations be classified as Zone 0. For all other Division 1 locations where the risk of volatile materials being present under normal operation is much lower, the less conservative correlation of Division 1 to Zone 1 was proposed.

PANEL ACTION: Accept in Principle.
See Proposal 14-478

PANEL STATEMENT: Proposal 14-478 addresses this issue.

EXPLANATION OF NEGATIVE:
COOK: See my Explanation of Negative Vote on Proposal 14-376a.

(Log #3996)

14- 478 - (Table 515-2): Accept

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Delete existing NEC Table 515-2 and insert proposed Table 6-2.2 from NFPA 30-May 2000 ROP (page 579-581) as new NEC Table 515-2.

Table 515-2 Electrical Area Classifications

Location	NEC Class I Division	NEC Class I Zone	Extent of Classified Area
Indoor equipment installed in accordance with 5-3 where flammable vapor-air mixtures can exist under normal operation	1	0	The entire area associated with such equipment where flammable gases or vapors are present continuously or for long periods of time.
	1	1	Area within 5 ft of any edge of such equipment, extending in all directions.
	2	2	Area between 5 ft and 8 ft of any edge of such equipment, extending in all directions; also, space up to 3 ft above floor or grade level within 5 ft to 25 ft horizontally from any edge of such equipment.[1]
Outdoor equipment of the type covered flammable in 5-3 where flammable vapor-air mixtures may exist under normal operation	1	0	The entire area associated with such equipment where gases or vapors are present continuously or for long periods of time.
	1	1	Area within 3 ft of any edge of such equipment, extending in all directions.
	2	2	Area between 3 ft and 8 ft of any edge of such equipment, extending in all directions; also, space up to 3 ft above floor or grade level within 3 ft to 10 ft horizontally from any edge of such equipment.
Tank storage installations inside buildings	1	1	All equipment located below grade level
	2	2	Any equipment located at or above grade level
Tank — aboveground	1	0	Inside fixed roof tank
	1	1	Area inside dike where dike height is greater than the distance from the tank to the dike for more than 50 percent of the tank circumference.
Shell, ends, or roof and dike area	2	2	Within 10 ft from shell, ends, or roof of tank. Also, area inside dikes to level of top of tank.
Vent	1	0	Area inside of vent piping or opening.
	1	1	Within 5 ft of open end of vent, extending in all directions.
	2	2	Area between 5 ft and 10 ft from open end of vent, extending in all directions.
Floating roof with fixed outer roof	1	0	Area ~~above the~~ between the floating and fixed roof sections and within the shell.
with no fixed outer roof	1	1	Area above the floating roof and within the shell.
Underground tank fill opening	1	1	Any pit, box, or space below grade level, if any part is within a Division 1 or 2, or Zone 1 or 2, classified location.
	2	2	Up to 18 in. above grade level within a horizontal radius of 10 ft from a loose fill connection, and within a horizontal radius of 5 ft from a tight fill connection.
Vent — discharging upward	1	0	Area inside of vent piping or opening
	1	1	Within 3 ft of open end of vent, extending in all directions.
	2	2	Area between 3 ft and 5 ft of open end of vent, extending in all directions.

Table 515-2 Electrical Area Classifications (continued)

Location	NEC Class I Division	Zone	Extent of Classified Area
Drum and container filling -- outdoors or indoors,	1	0	Area inside the drum or container.
	1	1	Within 3 ft of vent and fill openings, extending in all directions.
	2	2	Area between 3 ft and 5 ft from vent or fill opening, extending in all directions. Also, up to 18 in. above floor or grade level within a horizontal radius of 10 ft from vent or fill opening.
Pumps, bleeders, withdrawal fittings,			
Indoors	2	2	Within 5 ft of any edge of such devices, extending in all directions. Also up to 3 ft above floor or grade level within 25 ft Horizontally from any edge of such devices.
Outdoors	2	2	Within 3 ft of any edge of such devices, extending in all directions. Also up to 18 in. above grade level within 10 ft horizontally from any edge of such devices.
Pits and sumps			
without mechanical ventilation	1	1	Entire area within a pit or sump if any part is within a Division 1 or 2, or Zone 1 or 2, classified location.
with adequate mechanical ventilation	2	2	Entire area within a pit or sump if any part is within a Division 1 or 2, or Zone 1 or 2, classified location.
Containing valves, fittings, or piping, and not within a Division 1 or 2 , or Zone 1 or 2, classified location	2	2	Entire pit or sump.
Drainage ditches, separators, impounding basins			
Outdoor	2	2	Area up to 18 in. above ditch, separator, or basin. Also, area up to 18 in. above grade within 15 ft. horizontally from any edge.
Indoor			Same classified area as pits.
Tank vehicle and tank car[2] loading through open dome	1	0	Area inside of the tank.
	1	1	Within 3 ft of edge of dome, extending in all directions.
	2	2	Area between 3 ft and 15 ft from edge of dome, extending in all directions.
Loading through bottom connections with	1	0	Area inside of the tank.
atmospheric venting	1	1	Within 3 ft of point of venting to atmosphere, extending in all directions
	2	2	Area between 3 ft and 15 ft from point of venting to atmosphere, extending in all directions. Also, up to 18 in above grade within a horizontal radius of 10 ft from point of loading connection.
Office and rest rooms	Ordinary		If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as if the wall, curb, or partition did not exist.

Table 515-2 Electrical Area Classifications (continued)

Location	NEC Class I Division	Zone	Extent of Classified Area
Loading through closed dome with atmospheric venting	1	1	Within 3 ft of open end of vent, extending in all directions.
	2	2	Area between 3 ft and 15 ft from open end of vent, extending in all directions. Also within 3 ft of edge of dome, extending in all directions.
Loading through closed dome with vapor control	2	2	Within 3 ft of point of connection of both fill and vapor lines extending in all directions.
Bottom loading with vapor control or any bottom	2	2	Within 3 ft of point of connections, extending in all directions. unloading Also up to 18 in. above grade within a horizontal radius of 10 ft from point of connections.
Storage and repair garage for tank vehicles	1	1	All pits or spaces below floor level.
	2	2	Area up to 18 in. above floor or grade level for entire storage or repair garage.
Garages for other than tank vehicles	Ordinary		If there is any opening to these rooms within the extent of an outdoor classified location, the entire room shall be classified the same as the area classification at the point of the opening.
Outdoor drum storage	Ordinary		
Inside rooms or storage lockers used for the storage of Class I liquids	2	2	Entire room.
Indoor warehousing where there is no flammable liquid transfer	Ordinary		If there is any opening to these rooms within the extent of an indoor classified location, the room shall be classified the same as the wall, curb, or partition did not exist.
Piers and wharves			See Figure 5-7.16

For SI units: 1 in. = 25.4 mm; 1 ft = 0.3048 m.
[1]The release of Class I liquids may generate vapors to the extent that the entire building, and possibly ~~a zones~~ an area surrounding it, should be considered a Class I, Division 2, or Zone 2 location.
[2]When classifying extent of area, consideration shall be given to fact that tank cars or tank vehicles may be spotted at varying points. Therefore, the extremities of the loading or unloading positions shall be used.

SUBSTANTIATION: Based on the NFPA 30 Committee accepting Proposal 30-167 to change this extracted material, this proposal was developed as part of the work done by a Task Group including Donny Cook, Fred Walker, Gordon Johnson, Don Zipsi, Mark Goodman, Kevin Earley, Mark Ode, Bob Benedetti, and Richard Hild to correlate the two documents. The Task Group was not balloted on this proposal.
PANEL ACTION: Accept.

EXPLANATION OF NEGATIVE:
ZIPSE: See my Explanation of Negative Vote on Proposal 14-13.

(Log #4304)

14- 483 - (515-5(a)): Reject
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise the last sentence of this section as shown below:
"Where cable is used, it shall be enclosed in threaded rigid metal conduit or threaded steel intermediate metal conduit from 18 in. below finished grade ~~the point of lowest buried cable~~ level to ~~the point of connection to the aboveground raceway~~ at least 8 ft above finished grade level."
SUBSTANTIATION: The provisions of this section remain essentially the same as they were in the 1953 NEC, predating cables that are recognized for either direct-burial or aboveground stand-alone wiring. Such cables may not be connected to an aboveground raceway, but comprise an entire circuit that extends for some distance above ground as a stand-alone wiring method, which is not generally prohibited by Article 515. Because this section does not specifically address classified locations, the intent appears to be only to require physical protection. The revised text accommodates installations where cable wiring is extended aboveground and makes the requirements consistent with Section 300-5(d).
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has failed to provide adequate technical justification to support this change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Earley, Saban

(Log #925)

14- 484 - (515-6): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Buried raceways and cables under defined Class 1 locations which extend to floor or grade level shall be considered to be within a Class 1 Division 1 location.
SUBSTANTIATION: Editorial. Section 330-3 permits Type MI cable in hazardous (classified) locations and underground. Section 334-3 permits Type MC cable direct-buried and in hazardous locations per Section 501-4(a)(1) Exception No. 2 where listed for such applications. Section 300-5 permits direct-burial cable splices.
Where boxes covered by the exception for Section 370-29 are used for such splices they may be considered not required to be explosion-proof since the cables are not presently included in the rule. Cable seals for Type MC cable per Section 501-5(d)(1) are not required if the cable is not considered to be within a Class 1 Division 1 location.
Underground wiring may pass under vent locations which are Class 1 Division 1 locations which do not normally extend to the ground level. The proposal would exempt such wiring from the classified location requirement.
PANEL ACTION: Accept in Principle in Part.
Insert only the words "and cables" as shown and change the reference in the first sentence of current 515-6 to state "section 501-5", instead of "sections 501-5(a)4 and (b)2".
PANEL STATEMENT: All raceways and cables that pass under a Class I location are considered to be within a Class I location, regardless of where they emerge. The changes to the reference are to include all sealing requirements.

ARTICLE 516 — SPRAY APPLICATION, DIPPING, AND COATING PROCESSES

(Log #1268)

14- 486 - (516): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered by the Panel. The issues of raceway trade size, extracts, and use of soft versus hard metrication were all studied in detail and resolutions were communicated to the Panel prior to the Panel Meeting. It should be noted that all of the other Code-Making Panels accepted the metrication directive. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: In 516-2(a)(4), change "5-ft (1.52-m)" to "1.52-m (5-ft)" and "1 ft (305 mm)" to "305 mm (1 ft)". (Note: As is extracted material).

In 516-2(a)(5), change "25 ft (7.62 m)" to "7.62 m (25 ft)" in two places. (Note: As is extracted material).

In 516-2(b)(1), change "20 ft (6.10 m)" to "6.10 m (20 ft)" and "10 ft (3.05 m)" to "3.05 m (10 ft)". (Note: As is extracted material).

In Figure 516-2(b)(1), change "20 ft (6100 mm)" to "6100 mm (20 ft)" and "10 ft (3050 mm)" to "3050 mm (10 ft)". (Note: As is extracted material).

In 516-2(b)(2)(a), change "5 ft (1525 mm)" to "1525 mm (5 ft)" and "3 ft (915 mm)" to "915 mm (3 ft)". (Note: As is extracted material).

In Figure 516-2(b)(2), change "3-ft R (915 mm)" to "915 mm R (3 ft)" in twelve places; "5-ft R (1525 mm)" to "1525 mm R (5-ft)" in two places; and "10-ft R (3050 mm)" to "3050 mm R (10-ft)"two places. (Note: As is extracted material).

In 516-2(b)(2)(b), change "10 ft (3050 mm)" to "3050 mm (10 ft)" and "3 ft (915 mm)" to "915 mm (3 ft)". (Note: As is extracted material).

In 516-2(b)(3), change "3 ft (914 mm)" to "914 mm (3 ft)" in two places. (Note: As is extracted material).

In 516-2(b)(4), change "3 ft (914 mm)" to "914 mm (3 ft)". (Note: As is extracted material).

In Figure 516-2(b)(4), change "3 ft R" to "914 mm R (3-ft)" in seven places. (Note: SI Units are added and correspond to the text in the Section 516-2(b)(4), which is extracted material).

In Figure 516-2(b)(4), delete "For SI units: 1 ft = 0.3048 m." at the bottom of the figure.

In 516-2(b)(5), change "3 ft (914 mm)" to "914 mm (3 ft)". (Note: As is extracted material).

In Figure 516-2(b)(5), change "3 ft (1 m)" to "1 m (3 ft)" in six places; change "5 ft (1.5 m)" to "1.5 m (5 ft)" in six places; change "20 ft (6.1 m)" to "6.1 m (20 ft)" in two places. (Note: As is extracted material).

In Figure 516-2(b)(5), delete "Note: SI (metric) units shown in parenthesis are approximate. A more accurate conversion is 1.0 ft = 305 mm."

In 516-2(b)(6), change "20 ft (6.1 m)" to "6.1 m (20 ft)". (Note: As is extracted material).

In 516-2(b)(6) Ex, change "5 ft2 (0.46 m2)" to "0.46 m2 (5 ft2)" and "5 gal (18.9 L)" to "18.9 L (5 gal)". (Note: As is extracted material).

In 516-2(c) Ex, change "3 ft (914 mm)" to "914 mm (3 ft)". (Note: As is extracted material).

In 516-3(d) Ex. No. 2 (b), change "18 in. (45.7 cm)" to "450 mm (18 in.)".

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Reject.

PANEL STATEMENT: Panel 14 believes the following issues need further evaluation before changes are made to the code: trade sizes of conduit; extract policies; consistency from article to article within the code. For example, trade size of conduit is not a true dimension and cannot be converted to a true metric number.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

NEGATIVE: 3

NOT RETURNED: 2 Earley, Saban

EXPLANATION OF NEGATIVE:

KUCZKA: See my Explanation of Negative Vote on Proposal 14-10.

OMEARA: The proposal should be accepted, to be in conformance with Chapter 4 of the NFPA MOS-1 Manual of Style.

ZIPSE: See my Explanation of Negative Vote on Proposal 14-10.

(Log #3973)

14- 487 - (516): Accept in Principle

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposals 14-420,14-488, 14-489, 14-490, 14-491, 14-492, 14-493, 14-494, 14-495, 14-496, 14-497, 14-498, 14-499, 14-500, 14-501, 14-502, 14-503, 14-504, 14-505, 14-506, 14-507, 14-508, 14-509, 14-510, and 14-511. The Technical Correlating Committee directs the Panel to reconsider and clarify the Panel Action on this Proposal. Note references in 516-10(a), 516-10(a)(10)c, and others to sections 516-5, which is deleted in accordance with the Panel Action. The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual specifically with respect to 516-10. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL

RECOMMENDATION: Revise the entire Article 516 as follows:

Article 516 — Spray Application, Dipping, and Coating Processes

516.1. Scope. This article covers the regular or frequent application of flammable liquids, combustible liquids, and combustible powders by spray operations and the application of flammable liquids, or combustible liquids at temperatures above their flashpoint, by dipping, coating, or other means.

FPN: For further information regarding safeguards for these processes, such as fire protection, posting of warning signs, and maintenance, see NFPA 33, Standard for Spray Application Using Flammable and Combustible Materials, 1995 edition, and NFPA 34, Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids, 1995 edition. For additional information regarding ventilation, see NFPA 91, Standard for Exhaust Systems for Air Conveying of Materials, 1995 edition.

516.2. Definitions. For the purpose of this article, the following definitions shall apply:

Spray Area. Normally locations outside of buildings or localized operations within a larger room or space. Such are normally provided with some local vapor extraction/ventilation system. In automated operations the area limits shall be the maximum area in the direct path of spray operations. In manual operations the area limits shall be the maximum area of spray when aimed at 180 degrees to the application surface.

Spray Booth. An enclosure or insert within a larger room used for spray/coating/dipping applications. A spray booth may be fully enclosed or have open front or face and may include separate conveyor entrance and exit. The spray booth is provided with a dedicated ventilation exhaust but may draw supply air from the larger room or have a dedicated air supply.

Spray Room. A purpose fully enclosed room built for spray/coating/dipping applications provided with dedicated ventilation supply and exhaust. Normally the room is configured to house the item to be painted providing reasonable access around the intem/process. Depending on the size of the item being painted such rooms may actually be the entire building or the major portion thereof.

516.3. Classification of Locations. Classification is based on dangerous quantities of flammable vapors, combustible mists, residues, dusts, or deposits.

(a) Class I or Class II, Division 1 Locations. The following spaces shall be considered Class I or Class II, Division 1 locations, as applicable.

x1. The interior of spray booths and rooms except as specifically provided in Section 516.3(d).

x2. The interior of exhaust ducts.

x3. Any area in the direct path of spray operations.

x4. For dipping and coating operations, all space within a 5-ft (1.52-m) radial distance from the vapor sources extending from these surfaces to the floor. The vapor source shall be the liquid exposed in the process and the drainboard, and any dipped or coated object from which it is possible to measure vapor concentrations exceeding 25 percent of the lower flammable limit at a distance of 1 ft (305 mm), in any direction, from the object.

x5. Sumps, pits or below-grade channels within 25 ft (7.625 m) horizontally of a vapor source. If the sump, pit, or channel extends beyond 25 ft (7.625 m) from the vapor source, it shall be provided

with a vapor stop or it shall be classified as Class I, Division 1 for its entire length.

x6. The interior of any enclosed dipping or coating process or apparatus.

(b) Class I or Class II, Division 2 Locations. The following spaces shall be considered Class I or Class II, Division 2 as applicable.

x1. For open spraying, all space outside of but within 20 ft (6.10 m) horizontally and 10 ft (3.05 m) vertically of the Class I, Division 1 location as defined in Section 516.2(a), and not separated from it by partitions. See Figure 516.2(b)(1).

x2. If spray application operations are conducted within a closed-top, open-face, or open-front booth or room, any electrical wiring or utilization equipment located outside of the booth or room but within the boundaries designated as Division 2 in Figure 516-2(b)(2) shall be suitable for Class I, Division 2 or Class II, Division 2 locations, whichever is applicable. The Class I, Division 2 or Class II, Division 2 locations shown in Figure 516-2(b)(2) shall extend from the edges of the open face or open front of the booth or room in accordance with the following:

a. If the exhaust ventilation system is interlocked with the spray application equipment, then the Division 2 location shall extend 5 ft (1525 mm) horizontally and 3 ft (915 mm) vertically from the open face or open front of the booth or room, as shown in Figure 516.2(b)(2) top.

b. If the exhaust ventilation system is not interlocked with the spray application equipment, then the Division 2 location shall extend 10 ft (3.05 mm) horizontally and 3 ft (914 mm) vertically from the open face or open front of the booth or room, as shown in Figure 516.2(b)(2) bottom.

For the purposes of this subsection, interlocked shall mean that the spray application equipment cannot be operated unless the exhaust ventilation system is operating and functioning properly and spray application is automatically stopped if the exhaust ventilation system fails.

x3. For spraying operations conducted within an open top spray booth, the space 3 ft (914 mm) vertically above the booth and within 3 ft (914 mm) of other booth openings shall be considered Class I or Class II, Division 2.

x4. For spraying operations confined to an enclosed spray booth or room, the space within 3 ft (914 mm) in all directions from any openings shall be considered Class I or Class II, Division 2 as shown in Figure 516.2(b)(4).

x5. For dip tanks and drain boards, the 3 ft (914 mm) space surrounding the Class I, Division 1 location as defined in Section 516.2(a)(4) and as shown in Figure 516.2(b)(5).

x6. For dip tanks and drain boards, the space 3 ft (914 mm) above the floor and extending 20 ft (6.1 m) horizontally in all directions from the Class I, Division 1 location.

Exception: This space shall not be required to be considered a hazardous (classified) location where the vapor source area is 5 ft^2 (0.46 m^2) or less, and where the contents of the open tank trough, or container do not exceed 5 gal (18.9 L). In addition, the vapor concentration during operation and shutdown periods shall not exceed 25 percent of the lower flammable limit outside the Class I location specified in Section 516.2(a)(4).

x(c) Enclosed Coating and Dipping Operations. The space adjacent to an enclosed dipping or coating process or apparatus shall be considered unclassified.

Exception: The space within 3 ft (914 mm) in all directions from any opening in the enclosures shall be classified as Class I, Division 2.

(d) Adjacent Locations. Adjacent locations that are cut off from the defined Class I or Class II locations by tight partitions without communicating openings, and within which flammable vapors or combustible powders are not likely to be released, shall be unclassified.

(e) Unclassified Locations. Locations using drying, curing, or fusion apparatus and provided with positive mechanical ventilation adequate to prevent accumulation of flammable concentrations of vapors, and provided with effective interlocks to deenergize all electrical equipment (other than equipment approved for Class I locations) in case the ventilating equipment is inoperative, shall be permitted to be unclassified where the authority having jurisdiction so judges.

FPN: For further information regarding safeguards, see NFPA 86, Standard for Ovens and Furnaces, 1995 edition.

xFigure 516.2(b)(1) Class I or Class II, Division 2 location adjacent to an unenclosed spray operation.

Figure 516.2(b)(2) Class I or Class II, Division 2 locations adjacent to a closed top, open face, or open front spray booth or room.

xFigure 516.2(b)(4) Class I (or Class II), Division 2 locations adjacent to an enclosed spray booth or spray room.

xFigure 516.2(b)(5) Electrical area classification for open processes without vapor containment or ventilation.

516.4. Wiring and Equipment in Class I Locations.

(a) Wiring and Equipment — Vapors. All electric wiring and equipment within the Class I location (containing vapor only – not residues) defined in Section 516.2 shall comply with the applicable provisions of Article 501.

x(b) Wiring and Equipment — Vapors and Residues. Unless specifically listed for locations containing deposits of dangerous quantities of flammable or combustible vapors, mists, residues, dusts, or deposits (as applicable), there shall be no electrical equipment in any spray area as herein defined whereon deposits of combustible residue may readily accumulate, except wiring in rigid metal conduit, intermediate metal conduit, Type MI cable, or in metal boxes or fittings containing no taps, splices, or terminal connections.

(c) Illumination. Illumination of readily ignitable areas through panels of glass or other transparent or translucent material shall be permitted only if it complies with the following:

1. Fixed lighting units are used as the source of illumination;
2. The panel effectively isolates the Class I location from the area in which the lighting unit is located;
3. The lighting unit is approved for its specific location;
4. The panel is of a material or is protected so that breakage will be unlikely; and
5. The arrangement is such that normal accumulations of hazardous residue on the surface of the panel will not be raised to a dangerous temperature by radiation or conduction from the source of illumination.

x(d) Portable Equipment. Portable electric lamps or other utilization equipment shall not be used in a spray area during spray operations.

Exception No. 1: Where portable electric lamps are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type approved for Class I, Division 1 locations where readily ignitable residues may be present.

Exception No. 2: Where portable electric drying apparatus are used in automobile refinishing spray booths and the following requirements are met.

a. The apparatus and its electrical connections are not located within the spray enclosure during spray operations.

b. Electrical equipment within 18 in. (45.7 cm) of the floor is approved for Class I, Division 2 locations.

c. All metallic parts of the drying apparatus are electrically bonded and grounded.

d. Interlocks are provided to prevent the operation of spray equipment while drying apparatus is within the spray enclosure, to allow for a 3-minute purge of the enclosure before energizing the drying apparatus, and to shut off drying apparatus on failure of ventilation system.

(e) Electrostatic Equipment. Electrostatic spraying or detearing equipment shall be installed and used only as provided in Section 516.8.

FPN: For further information, see NFPA 33, Standard for Spray Application Using Flammable and Combustible Materials, 1995 edition.

516.5. Wiring and Equipment Embedded, Underslab, or Underground. (RESERVED)

516.6. Sealing (RESERVED)

516.7. Wiring and Equipment Not Within Class I and II Locations.

(a) Wiring. All fixed wiring above the Class I and II locations shall be in metal raceways, rigid nonmetallic conduit, or electrical nonmetallic tubing, or shall be Type MI, TC, or MC cable. Cellular metal floor raceways shall be permitted only for supplying ceiling outlets or extensions to the area below the floor of a Class I or II location, but such raceways shall have no connections leading into or through the Class I or II location above the floor unless suitable seals are provided.

(b) Equipment. Equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, where installed above a Class I or II location or above a location where freshly finished goods are handled, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

x516-9. Special Equipment.

(a) Fixed Electrostatic Equipment. This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, and/or precipitation of hazardous materials

for coatings on articles or for other similar purposes in which the charging or atomizing device is attached to a mechanical support or manipulator. This shall include robotic devices. This section shall not apply to devices that are held or manipulated by hand. Where robot or programming procedures involve manual manipulation of the robot arm while spraying with the high voltage on, the provisions of Section 516.5 shall apply. The installation of electrostatic spraying equipment shall comply with Sections 516.4(a) through (j). Spray equipment shall be listed or approved. All automatic electrostatic equipment systems shall comply with Section 516.4(a) through (i).

(1) Power and Control Equipment. Transformers, high-voltage supplies, control apparatus, and all other electric portions of the equipment shall be installed outside of the Class I location as defined in Section 516.2 or be of a type approved for the location.

Exception: High-voltage grids, electrodes, electrostatic atomizing heads, and their connections shall be permitted within the Class I location.

(2) Electrostatic Equipment. Electrodes and electrostatic atomizing heads shall be adequately supported in permanent locations and shall be effectively insulated from ground. Electrodes and electrostatic atomizing heads that are permanently attached to their bases, supports, reciprocators, or robots shall be deemed to comply with this section.

(3) High-Voltage Leads. High-voltage leads shall be properly insulated and protected from mechanical damage or exposure to destructive chemicals. Any exposed element at high voltage shall be effectively and permanently supported on suitable insulators and shall be effectively guarded against accidental contact or grounding.

(4) Support of Goods. Goods being coated using this process shall be supported on conveyors or hangers. The conveyors or hangers shall be arranged to (1) ensure that the parts being coated are electrically connected to ground with a resistance of 1 megohm or less and (2) to prevent parts form swinging.

(5) Automatic Controls. Electrostatic apparatus shall be equipped with automatic means that will rapidly deenergize the high-voltage elements under any of the following conditions:

a. Stoppage of ventilating fans or failure of ventilating equipment from any cause.

b. Stoppage of the conveyor carrying goods through the high-voltage field unless stoppage is required by the spray process.

c. Occurrence of excessive current leakage at any point in the high-voltage system.

d. Deenergizing the primary voltage input to the power supply.

(6) Grounding. All electrically conductive objects in the spray area, except those objects required by the process to be at high voltage, shall be adequately grounded. This requirement shall apply to paint containers, wash cans, guards, hose connectors, brackets, and any other electrically conductive objects or devices in the area.

(7) Isolation. Safeguards such as adequate booths, fencing, railings, interlocks, or other means shall be placed about the equipment or incorporated therein so that they, either by their location or character, or both, ensure that a safe separation of the process is maintained.

(8) Signs. Signs shall be conspicuously posted to.

a. Designate the process zone as dangerous with regard to fire and accident,

b. Identify the grounding requirements for all electrically conductive objects in the spray area, and

c. Restrict access to qualified personnel only.

(9) Insulators. All insulators shall be kept clean and dry.

(10) Other Than Nonincendive Equipment. Spray equipment that cannot be classified as nonincendive shall comply with (1) and (2).

a. Conveyors or hangers shall be arranged so to maintain a safe distance of at least twice the sparking distance between goods being painted and electrodes, electrostatic atomizing heads, or charged conductors. Warnings defining this safe distance shall be posted.

b. The equipment shall provide an automatic means of rapidly deenergizing the high-voltage elements in the event the distance between the goods being painted and the electrodes or electrostatic atomizing heads falls below that specified in (1).

c. Electrostatic Hand-Spraying Equipment. This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, and/or precipitation of materials for coatings on articles, or for other similar purposes in which the atomizing device is hand held or manipulated during the spraying operation. Electrostatic hand-spraying equipment and devices used in connection with paint-spraying operations shall be of approved types and shall comply with Sections 516.5(a) through (e).

(1) General. The high-voltage circuits shall be designed so as not to produce a spark of sufficient intensity to ignite the most readily ignitable of those vapor-air mixtures likely to be encountered, no result in appreciable shock hazard upon coming in contact with a grounded object under all normal operating conditions. The electrostatically charged exposed elements of the hand gun shall be capable of being energized only by an actuator that also controls the coating material supply.

(2) Power Equipment. Transformers, power packs, control apparatus, and all other electric portions of the equipment shall be located outside of the Class I location or be approved for the location.

Exception: The hand gun itself and its connections to the power supply shall be permitted within the Class I location.

(3) Handle. The handle of the spraying gun shall be electrically connected to ground by a metallic connection and be constructed so that the operator in normal operating position is in intimate electrical contact with the grounded handle to prevent buildup of a static charge on the operator's body. Signs indicating the necessity for grounding other persons entering the spray area shall be conspicuously posted.

(4) Electrostatic Equipment. All electrically conductive objects in the spraying area shall be adequately grounded. This requirement shall apply to paint containers, wash cans, and any other electrical conductive objects or devices in the area. The equipment shall carry a prominent, permanently installed warning regarding the necessity for this grounding feature.

(5) Support of Objects. Objects being painted shall be maintained in metallic contact with the conveyor or other grounded support. Hooks shall be regularly cleaned to ensure adequate grounding of 1 megohm or less. Areas of contact shall be sharp points or knife edges where possible. Points of support of the object shall be concealed from random spray where feasible; and, where the objects being sprayed are supported from a conveyor, the point of attachment to the conveyor shall be located so as to not collect spray material during normal operation.

c. Powder Coating. This section shall apply to processes in which combustible dry powders are applied. The hazards associated with combustible dusts are present in such a process to a degree, depending on the chemical composition of the material, particle size, shape, and distribution.

FPN: The hazards associated with combustible dusts are inherent in this process. Generally speaking, the hazard rating of the powders employed depends on the chemical composition of the material, particle size, shape, and distribution.

(1) Electric Equipment and Sources of Ignition. Electric equipment and other sources of ignition shall comply with the requirements of Article 502. Portable electric lamps and other utilization equipment shall not be used within a Class II location during operation of the finishing processes. Where such lamps or utilization equipment are used during cleaning or repairing operations, they shall be of a type approved for Class II, Division 1 locations, and all exposed metal parts shall be effectively grounded.

Exception: Where portable electric lamps are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type approved for Class II, Division 1 locations where readily ignitable residues may be present.

(2) Fixed Electrostatic Spraying Equipment. The provisions of Sections 516.4 and 516.6(a) shall apply to fixed electrostatic spraying equipment.

(3) Electrostatic Hand-Spraying Equipment. The provisions of Section 516.5 and Section 516.6(a) shall apply to electrostatic hand-spraying equipment.

(4) Electrostatic Fluidized Beds. Electrostatic fluidized beds and associated equipment shall be of approved types. The high-voltage circuits shall be designed so that any discharge produced when the charging electrodes of the bed are approached or contacted by a grounded object shall not be of sufficient intensity to ignite any powder-air mixture likely to be encountered nor to result in an appreciable shock hazard.

a. Transformers, power packs, control apparatus, and all other electric portions of the equipment shall be located outside the powder-coating area or shall otherwise comply with the requirements of Section 516.6(a).

Exception: The charging electrodes and their connections to the power supply shall be permitted within the powder-coating area.

b. All electrically conductive objects within the powder-coating area shall be adequately grounded. The powder-coating equipment shall carry a prominent, permanently installed warning regarding the necessity for grounding these objects.

c. Objects being coated shall be maintained in electrical contact (less than 1 megohm) with the conveyor or other support in order

to ensure proper grounding. Hangers shall be regularly cleaned to ensure effective electrical contact. Areas of electrical contact shall be sharp points or knife edges where possible.

d. The electric equipment and compressed air supplies shall be interlocked with a ventilation system so that the equipment cannot be operated unless the ventilating fans are in operation.

516.9. through 516.15. (RESERVED)

516.16. Grounding. All metal raceways, the metal armors or metallic sheath on cables, and all noncurrent-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded as provided in Article 250. Grounding in Class I locations shall comply with Section 501.16.

SUBSTANTIATION: This proposal is the work of a Task Group including Donny Cook, Fred Walker, Gordon Johnson, Don Zipsi, Mark Goodman, Kevin Earley, Mark Ode, Bob Benedetti, and Richard Hild. The Task Group was not balloted. The purpose of this proposal is to provide parallel numbering from Article 511 through 516 to comply with Section 2.4.1 of the NEC Style Manual.

PANEL ACTION: Accept in Principle.

Renumber 516-9 to 516-10. Delete 516-5, 516-6, and 516-9 through 516-15 (RESERVED).

PANEL STATEMENT: Proposal 14-420 addresses this issue. The minor changes implement a standardized numbering format for Articles 511 through 516.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Earley, Saban

COMMENT ON AFFIRMATIVE:

WECHSLER: See my Comment on Affirmative Vote on Proposal 14-13.

(Log #1656)

14- 488 - (516-2(e)): Accept

SUBMITTER: Donald R. Cook, Shelby County Building Insp., AL/Rep. Southern Section, IAEI

RECOMMENDATION: Revise first paragraph to read as follows:

Locations using drying, curing, or fusion apparatus and provided with positive mechanical ventilation adequate to prevent accumulation of flammable concentrations of vapors, and provided with effective interlocks to deenergize all electrical equipment (other than equipment ~~approved~~ (identified) for Class I locations) in case the ventilating equipment is inoperative, shall be permitted to be unclassified where the authority having jurisdiction so judges.

SUBSTANTIATION: If approved is the desired requirement of CMP 14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.

PANEL ACTION: Accept.

PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

14- 495 - (516-3(d) Exception No. 2 (b)): Accept
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise the Exception to read as follows:
"Electrical equipment within 18 in. (45.7 cm) of the floor is ~~approved~~ (identified) for Class I, Division 2 locations."
SUBSTANTIATION: If approved is the desired requirement of CMP-14, it is already required by Section 110-2. If the panel desires that this equipment, or technique be suitable for some specific purpose, then "identified" would be a more accurate term, based on Article 100, NEC definitions. The authority having jurisdiction would have no basis for approval of the equipment or technique unless it was suitable for the specific purpose.
PANEL ACTION: Accept.
PANEL STATEMENT: Acceptance of this proposal is contingent upon acceptance of the Fine Print Note to the definition of "Identified" in Proposal 14-4a.

(Log #926)

14- 511 - (516-16): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Grounding. All metal raceways, the metal armor or metallic sheath on cables, and all exposed noncurrent-carrying metal parts of fixed or portable electrical equipment likely to become energized, regardless of voltage, shall be grounded. ~~As provided in Article 250.~~ Grounding in Class 1 and Class 2 locations shall comply with Sections 501-16 and 502-16, respectively.
SUBSTANTIATION: If a metal part is not subject to contact such as internal isolated parts, grounding of such parts does not seem necessary. "Exposed" and "likely to be" are conditions of other sections. It has been interpreted by some that "as provided in Article 250" includes provisions in that article which permit nongrounding and I believe that is technically correct. However, the tenor of this section seems to require grounding. If that is the intent, the proposal provides clarification.
If it is felt necessary to note Section 501-16, Section 502-16 should also be noted.
PANEL ACTION: Accept in Part.
Add "and Class II" where indicated and add "and 502-16, respectively" where indicated.
PANEL STATEMENT: Non-current carrying metal parts are required to be grounded to facilitate opening of the protective device. In addition, there is the concern of static electricity.

ARTICLE 517 — HEALTH CARE FACILITIES

(Log #1082)

17- 3 - (517): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 517 as follows:
517-14 - change "No. 10" to "10 AWG"
517-19(c) - change "No. 10" to "10 AWG"
517-74(b) - change "No. 18 or No. 16" to "18 or 16 AWG".
SUBSTANTIATION: To provide consistency throughout the Code The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #1275)

17- 4 - (517): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 517-3 definition of Patient Vicinity replace "6 ft (1.83 m)" with "1.8 m (6 ft)"
2. In Section 517-3 definition of Patient Vicinity replace "7 1/2 ft (2.29 m)" with "2.3 m (7 1/2 ft)"
3. In Section 517-13(a) Ex. No. 3 replace "7 1/2 ft (2.2 m)" with "2.3 m (7 1/2 ft)"
4. In Section 517-30(c)(3) Ex. No. 4 replace "2 in. (50.8 mm)" with "50 mm (2 in.)"
5. In Section 517-34(b)(1) Ex. (a) replace "+20°F (-6.7°C)" with "-6.7°C (20°F)"
6. In Section 517-34(b)(1) Ex. (b) replace "+20°F (-6.7°C)" with "-6.7°C (20°F)"
7. In Section 517-43(b)(1) Ex. (a) replace "+20°F (-6.7°C)" with "-6.7°C (20°F)"
8. In Section 517-43(b)(1) Ex. (b) replace "+20°F (-6.7°C)" with "-6.7°C (20°F)"
9. In Section 517-60(a)(1) replace "5 ft (1.52 m)" with "1.52 m (5 ft)"
10. In Section 517-61(a)(7) replace "3 in. (76 mm)" with "75 mm (3 in.)"
11. In Section 517-61(c)(1) Ex. replace "6 ft (1.83 m)" with "1.8 m (6 ft)"
12. In Section 517-63(b)(3) replace "8 ft (2.44 m)" with "2.5 m (8 ft)"
13. In Section 517-63(c)(1) replace "8 ft (2.44 m)" with "2.5 m (8 ft)"
SUBSTANTIATION: The proposed revisions are intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units. For those conversions involving extracted materials, the numeric values were not rounded and only the order in which the units appear was changed.
PANEL ACTION: Accept.

17- 5 - (517-1): Accept in Principle

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise as follows:

The provisions of this article shall apply to electrical construction and installation criteria in human health care facilities.

~~FPN No. 1: This article is not intended to apply to veterinary facilities.~~

FPN ~~No. 2:~~ For information concerning performance...

SUBSTANTIATION: This change will allow for the elimination of FPN No. 1.

The Foreward to the NEC Style Manual states, "It is vitally important that the text be as explicit as possible...". The Style Manual also states in 3.1.3 Fine Print Notes, "Fine Print Notes contain explanatory information."

If a FPN is needed to ensure that veterinary facilities are not intended, then it would be more explicit to so state in the basic rule by adding the word "human."

PANEL ACTION: Accept in Principle.

Revise the submitter's recommedation to read as follows:

Revise as follows:

The provisions of this article shall apply to electrical construction and installation criteria in health care facilities providing services to human beings.

~~FPN No. 1: This article is not intended to apply to veterinary facilities.~~

FPN ~~No. 2:~~ For information concerning performance...

PANEL STATEMENT: The revised text is consistent with the scope of NFPA 99 and meets the intent of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 3 Clark, Nash, Telecky

(Log #2804)

17- 6 - (517-1): Reject

SUBMITTER: Bud Swathwood, Bud Swathwood Consulting

RECOMMENDATION: Add to the sentence, after the word facilities to read:

including chiropractic clinics.

SUBSTANTIATION: It has been a long time argument that chiropractic methods are not medical treatments. The examining rooms in these clinics should follow the same rules as all medical clinics for the redundant grounding wiring method. The argument is a fact that the "patients" are examined and treated in examining rooms and many times with equipment meeting NEC 517-2 and 517-13; and also the definition in 517-3 "Health Care Facilities and patient care areas."

PANEL ACTION: Reject.

PANEL STATEMENT: The term "chiropractic" is not defined in the NEC or in NFPA 99 and the need for compliance with Article 517 depends on the type of service being provided.

The definition of "health care facilities" is the responsibility of NFPA 99 not the NEC.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 3 Clark, Nash, Telecky

(Log #CP1701)

17- 6a - (517-2, 517-3): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.The Technical Correlating Committee understands the actions in Proposal 17-5 further modify the recommendation.

SUBMITTER: CMP 17

RECOMMENDATION: Modify 517-2 as follows:

Delete the section number a section title, "517-2 General," and insert the section text after the first sentence of 517-1.

Renumber existing 517-3 as 517-2.

517-1, 2 and 3 will read as follows:

"517-1. Scope

The provisions of this article shall apply to electrical construction and installation criteria in health care facilities. The requirements in Parts B and C apply not only to single-function buildings, but are also intended to be individually applied to their respective forms of occupancy within a multifunction building (e.g., a doctor's examining room located within a limited care facility would be required to meet the provisions of Section 517-10).

FPN No. 1: This article is not intended to apply to veterinary facilities.

FPN No. 2: For information concerning performance, maintenance, and testing criteria, refer to the appropriate health care facilities documents.

517-2. Definitions

[The definitions are unchanged by this proposal.]

SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Definitions are required to be in 517-2.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 3 Clark, Nash, Telecky

COMMENT ON AFFIRMATIVE:

STEPLOWSKI: The panel's recommendation in this proposal should incorporate the revisions as accepted in Proposal 17-5. It should read as follows:

Modify 517-2 as follows:

Delete the section number and section title, "517-2 General," and insert the section text after the first sentence of 517-1.

Renumber existing 517-3 as 517-2.

517-1 and 517-2 will read as follows:

517-1 Scope. The provisions of this article shall apply to electrical construction and installation criteria in health care facilities providing services to human beings. The requirements in Parts B and C apply not only to single-function buildings, but are also intended to be individually applied to their respective forms of occupancy within a multifunction building (e.g., a doctor's examining room located within a limited care facility would be required to meet the provisions of Section 517-10).

FPN: For information concerning performance, maintenance, and testing criteria, refer to the appropriate health care facilities documents.

517-2. Definitions

(The definitions are unchanged by this proposal).

(Log #1527)

17- 7 - (517-3): Accept in Principle

SUBMITTER: Victor V. Timpanaro, Old Bridge , NJ

RECOMMENDATION: Add wording "psychiatric" to list of items identified in a building or portion of a building. Should be "TIA."

SUBSTANTIATION: NFPA 99 on page 99-18 of the standard includes "psychiatric" as a health care facility. To keep consistency between NFPA 70 and NFPA 99. This wording should be included.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to the panel action on Proposal 17-11 which now includes the term "psychiatric" accomplishing the submitter's intent.

17- 8 - (517-3): Reject

SUBMITTER: Behzad Eghtesady, City of Los Angeles, CA

RECOMMENDATION: Revise the text to read:

Patient Bed Location: The location of an inpatient sleeping bed; or the bed or procedure table used in a crtical or general patient care area.

SUBSTANTIATION: The current definition does not include "general" patient care areas. This causes a problem in section 517-18 which makes numerous referances to such an area. This revision will clarify that the definition of "Patient Bed Location" includes "general" patient care areas and eliminates any confusion that may arise from the current code definition.

PANEL ACTION: Reject.

PANEL STATEMENT: The current text is clear as written and is consistent with NFPA 99. The procedure tables intended to be included are only those in critical care areas.

(Log #1392)
17- 9 - (517-3-Anesthetizing Location): Accept in Part
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise to read as follows:
Anesthetizing Location. Any area of a ~~health care~~ facility that has been designated to be used for the administration of ~~flammable or~~ nonflammable inhalation anesthetic agents in the course of examination or treatment, including the use of such agents for relative analgesia.
SUBSTANTIATION: NFPA has developed a glossary of standard terms that are used in all of its codes and standards. One of the goals of the glossary project is to provide a single consistent definition for each term that can be used in each code or standard in which the term is used. In this instance, the preferred definition can be found in NFPA 99. This proposal recommends using that definition.
PANEL ACTION: Accept in Part.
Revise the submitter's recommendation to read as follows:
Revise to read as follows:
Anesthetizing Location. Any area of a ~~health care~~ facility that has been designated to be used for the administration of any flammable or nonflammable inhalation anesthetic agent in the course of examination or treatment, including the use of such agents for relative analgesia.
PANEL STATEMENT: The panel rejects the elimination of "flammable." While the panel understands the desire to correlate with NFPA 99, the definition in the NEC needs to be different. Flammable agents are still used in many parts of the world where the NEC is used.

(Log #1393)
17- 10 - (517-3-Emergency System): Accept in Principle
Note: The Technical Correlating Committee directs the Panel to reconsider the Proposal and clarify if emergency systems in this Article are intended to modify Article 700. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise to read:
Emergency System. A system of ~~feeders and branch~~ circuits and equipment meeting the requirements of Article 700, except as amended by Article 517, intended to supply alternate power to a limited number of prescribed functions vital to the protection of life and ~~patient~~ safety ~~with automatic restoration of electrical power within 10 seconds of power interruption.~~
SUBSTANTIATION: NFPA has developed a glossary of standard terms that are used in all of its codes and standards. One of the goals of the glossary project is to provide a single consistent definition for each term that can be used in each code or standard in which the term is used. In this instance, the preferred definition can be found in NFPA 99. This proposal recommends using that definition. In addition, it should be noted that the existing definition contains a requirement (within 10 seconds). If this requirement is not covered elsewhere and it is needed, CMP 17 should add it to the body of Article 517.
PANEL ACTION: Accept in Principle.
Replace the definition of emergency system with that in NFPA 99 to read as follows:
"Emergency System. A system of circuits and equipment intended to supply alternate power to a limited number of prescribed functions vital to the protection of life and safety."
PANEL STATEMENT: This correlates the definition exactly with that in NFPA 99. Reference to requirements in other articles is not appropriate in a definition.

(Log #927)
17- 12 - (517-3-Isolated Power Systems): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Isolated Power Systems. ~~A~~ An ungrounded system comprising an isolating transformer or its equivalent, a line isolation monitor, and its ungrounded circuit conductors.
Isolation Transformer. A transformer of the multiple winding type, with the primary and secondary windings physically separated, with an ungrounded secondary, which inductively couples its secondary winding to the grounded feeder systems that energize its primary winding.
SUBSTANTIATION: An ungrounded system and secondary must be assumed by perceived intent of other sections. However, this is not specified in the definitions. An isolated power system could have ungrounded circuit conductors with system grounding (no grounded circuit conductor). The definition of isolation transformer could apply to any transformer with separated primary

and secondary windings even where the secondary is grounded, such as required in Section 250-30.

The proposal for isolated power systems would encompass those served by battery or generator power sources permitted by Section 517-160.

Acceptance of this proposal would clarify the word "isolated" used in other sections.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposed change in the first definition is redundant. As written, the system includes the ungrounded circuit conductors.

These are the same definitions as in NFPA 99. The panel does not want to deviate from NFPA 99 unless there is a compelling reason.

(Log #2492)

17- 14 - (517-13 Exception No. 3): Reject

SUBMITTER: Lynn Adams, Escambia County, FL

RECOMMENDATION: Revise as follows:

Exception No. 3: Light fixtures more than 7 1/2 ft above the floor and switches located outside of the patient vicinity shall ~~not~~ be required to be grounded by an insulated grounding conductor, or a metal raceway, or listed Types MI, MC, or AC cables; provided the outer metal armor sheath of the cable is identified as an acceptable grounding return path.

SUBSTANTIATION: As written the exception requires metal raceway as the only approved means of grounding fixtures or switches outside the patient care area. The intent may be to allow 517-13(a) Exception No. 1 or 517-13(b) to apply and allow this type of grounding; however the rule as written does not. If this is the intent it would be more clearly stated in the paragraph dealing with light fixtures in that area.

PANEL ACTION: Reject.

PANEL STATEMENT: As written 517-13(a) requires metal raceways and an insulated grounding conductor. The intent of Exception No. 3 is to allow the redundancy of the insulated ground conductor to be optional. For light fixtures more than 71/2 ft above the floor and switches located outside of the patient vicinity 517-13(a) and 517-13(a) Exception No. 1 can be applied to have either metal raceways or listed Types MI, MC, or AC cables used. The proposed revision would allow non-metallic raceways or non-metallic cables to be used which is not intended.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 3 Clark, Nash, Telecky

(Log #3878)

17- 15 - (517-13(a) and (b)): Accept in Principle

SUBMITTER: J. Philip Simmons, Olympia, WA

RECOMMENDATION: Revise text to read as follows:

(a) Patient Care Area. Wiring in patient care areas shall comply with (1) and (2) below.

(1) Wiring Methods. All branch circuits serving patient care areas shall be provided with a ground path for fault current by installation in a metal raceway system, or a cable armor or sheath assembly that qualifies as an equipment grounding return path in accordance with Section 250-118. Type AC, Type MC, Type MI cables shall have an outer metal armor or sheath that is identified as an acceptable grounding return path in accordance with Section 250-118.

(2) Insulated Equipment Grounding Conductor. In areas used for patient care, the grounding terminals of all receptacles and all noncurrent-carrying conductive surfaces of fixed electric equipment likely to become energized that are subject to personal contact, operating at over 100 volts, shall be grounded by an insulated copper conductor. The grounding conductor shall be sized in accordance with Table 250-122 and installed in the metal raceways or metal-clad cables with the branch-circuit conductors supplying these receptacles or fixed equipment.

Exception No. 1: ~~Metal raceways shall not be required where listed Types MI, MC, or AC cables are used, provided the outer metal armor or sheath of the cable is identified as an acceptable grounding return path.~~

~~Exception No. 2:~~ Metal faceplates shall be permitted to be grounded by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.

Exception No. 2~~3~~: Light fixtures more than 7 1/2 ft (2.2 m) above the floor and switches located outside of the patient vicinity shall not be required to be grounded by an insulated equipment grounding conductor.

~~(b) Methods. In addition to the requirements of Section 517-13(a), all branch circuits serving patient care areas shall be provided with a ground path for fault current by installation in a metal raceway system or cable assembly. The metal raceway system, or cable armor or sheath assembly, shall itself qualify as an equipment grounding return path in accordance with Section 250-118. Type MC cable and Type MI cable shall have an outer metal armor or sheath that is identified as an acceptable grounding return path.~~

SUBSTANTIATION: Editorial revisions to organize this section to emphasize the wiring method is intended to provide the primary equipment ground-fault path and the insulated equipment grounding conductor provides the secondary path. This concept has been repeatedly emphasized by CMP-17 over several Code cycles. With this organization of this section, Exception No. 1 is not needed as the requirement for the construction of metal-clad cables is in the basic rule.

PANEL ACTION: Accept in Principle.

Revise the submitter's recommendation to read as follows:

Revise text to read as follows:

517-13 Grounding of Receptacles and Fixed Electric Equipment in Patient Care Areas.

(a) Patient Care Area. Wiring in patient care areas shall comply with (1) and (2) below.

(1) Wiring Methods. All branch circuits serving patient care areas shall be provided with a ground path for fault current by installation in a metal raceway system, or a cable armor or sheath assembly that itself qualifies as an equipment grounding return path in accordance with Section 250-118. Type AC, Type MC, Type MI cables shall have an outer metal armor or sheath that is identified as an acceptable grounding return path. in accordance with Section 250-118.

(2) Insulated Equipment Grounding Conductor. In areas used for patient care, the grounding terminals of all receptacles and all noncurrent-carrying conductive surfaces of fixed electric equipment likely to become energized that are subject to personal contact, operating at over 100 volts, shall be grounded by an insulated copper conductor. The grounding conductor shall be sized in accordance with Table 250-122 and installed in the metal raceways or metal-clad cables with the branch-circuit conductors supplying these receptacles or fixed equipment.

Exception No. 1: ~~Metal raceways shall not be required where listed Types MI, MC, or AC cables are used, provided the outer metal armor or sheath of the cable is identified as an acceptable grounding return path.~~

~~Exception No. 2:~~ Metal faceplates shall be permitted to be grounded by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.

Exception No. 2~~3~~: Light fixtures more than 7 1/2 ft (2.2 m) above the floor and switches located outside of the patient vicinity shall not be required to be grounded by an insulated equipment grounding conductor.

~~(b) Methods. In addition to the requirements of Section 517-13(a), all branch circuits serving patient care areas shall be provided with a ground path for fault current by installation in a metal raceway system or cable assembly. The metal raceway system, or cable armor or sheath assembly, shall itself qualify as an equipment grounding return path in accordance with Section 250-118. Type MC cable and Type MI cable shall have an outer metal armor or sheath that is identified as an acceptable grounding return path.~~

PANEL STATEMENT: The text has been revised to comply with the NEC Style Manual and to delete redundant wording.

The panel disagrees with the submitter's substantiation in that it does not view the two paths as "primary"and "secondary". Rather it views them as two independent means of grounding.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 3 Clark, Nash, Telecky

(Log #3301)

17- 16 - (517-13(a) Exception No. 1): Reject

SUBMITTER: George A. Straniero, AFC Cable Systems

RECOMMENDATION: Revise Exception No. 1 as follows:

Exception No. 1: Metal raceways shall not be required where listed Types MI, MC, or AC cables are used, provided the outer metal armor or sheath of the cable is identified as an acceptable grounding return path, or where the combined metal sheath and grounding conductor of listed No. 14, 12 or 10 AWG interlocked Armor Type MC cable is used in lengths not exceeding 100 feet.

SUBSTANTIATION: The intent of 517-13(a), Exception No. 1, as stated by the panel in 98 ROC 17-6, is that the metal sheath or armor of these cables (interlocked armor Type MC cable) of itself shall provide a suitable mechanical grounding means. The metal sheath of interlocked armored Type MC cables, of it self, does provide a suitable mechanical grounding means in lengths not exceeding 100 feet.

A worst case condition for this construction is when a conductor to armor fault occurs at the midpoint of a cable circuit length. This condition would require the armor alone to serve the ground fault path. Where limited to a conservative circuit length of 100 feet the interlocked armor, of itself, provides a suitable mechanical grounding means.

The following schematic diagram of a worst case fault condition demonstrates that the fault current will split according to Kirchoff's Current Law. The fault current will split proportionally at the point of the fault based on the fault path resistance of each path. The two fault paths are as follows:

Fault path #1: Through the armor to the load side termination where the armor and the ground wire are bonded to form the combination armor and grounding conductor recognized in Section 250-118(11). The path continues through the ground conductor to the supply side termination.

Fault path #2: Through the armor to the supply side termination where the armor and the ground wire are bonded to form the combination armor and grounding conductor recognized in Section 250-118(11).

The maximum length of the fault path in order to clear a ground fault is given by the IAEI Soares Book on Grounding. Soares recommends a minimum desired fault current of 5 times the overcurrent device rating. Also recommended is a 50 volt drop to account for an arcing type of fault.

For a #12 AWG, 120 Volts, 20 ampere circuit; the maximum length of the fault path is determined by the impedance necessary to allow a fault current of 5 times the overcurrent device rating to flow through the fault path.

$$Z_T = \frac{\text{Circuit Voltage} \ — \ \text{Arc Voltage}}{5 \text{ X overcurrent device rating}}$$

$$Z_T = \frac{120 - 50}{5 \text{ x } 20} \quad Z = \ 0.7 \text{ Ohms}$$

For a 100 ft branch circuit the worst case impedance of fault path orginates at the midpoint of the cable. The impedance of the fault path is the parallel paths in each direction from the point of the fault.

For path #1 the impedance is that of 50 feet of the armor and 100 ft of the ground conductor.

$$Z\#1 = (L_{Armor} \text{ X } Z_{Armor}) + (L_{Conductor} \text{ X } Z_{Conductor})$$

$$Z\#1 = (50 \text{ ft x } 0.00617\Omega/\text{ft.}) + (100 \text{ ft X } .00162\Omega/\text{ft.}) = .471\Omega$$

For path #2 the impedance is that of 50 feet of the armor.

$$Z\#2 = (L_{Armor} \text{ X } Z_{Armor})$$

$$Z\#2 = (50 \text{ ft x } 0.00617\Omega/\text{ft.}) = 0.309\Omega$$

The total impedance of the parallel paths from the point of the fault at the midpoint of the cable is:

$$Z_{\text{Fault Path total}} = 1/(1/Z\#1 + 1/Z\#2) = 1/(1/.471 + 1/.309) = 0.187\ \Omega$$

The impedance of the cable fault path for the 100 ft cable with a fault at its midpoint is 01.87 Ω which is well within the maximum 0.7 Ω recommended by the IAEI Soare's Book on Grounding.

The worst case impedance of the mechanical grounding means for the 100 ft cable for #14, 12, and 10 AWG cables is as shown below and on the next page:

PANEL ACTION: Reject.

PANEL STATEMENT: The outer sheath of interlocked armor Type MC cable is not itself identified as an acceptable grounding path and therefore does not meet the conditions of Exception No. 1.

The intent is to have 2 independent grounding means; one being the outer metal armor or sheath itself, and the other being the insulated copper conductor.

The submitters substitution is in conflict with the UL guide information for interlocked metal tape sheath MC cable. The listing information for that type of MC cable requires a grounding conductor for all lengths.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

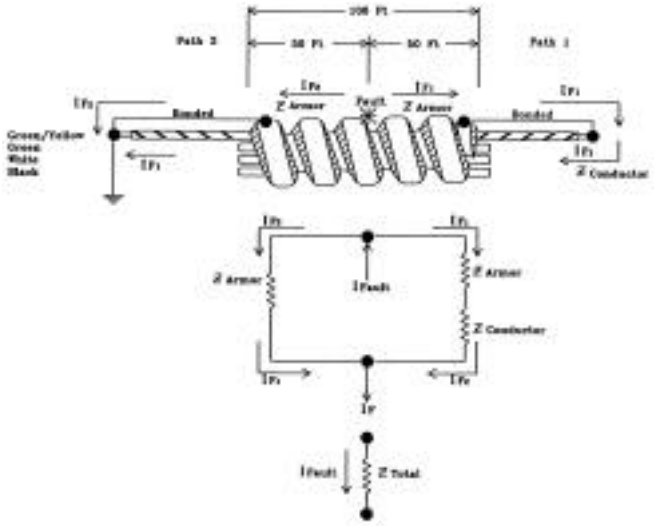
AFFIRMATIVE: 12

NOT RETURNED: 3 Clark, Nash, Telecky

Conductor Size	Conductor Impedance per Ft	Armor Impedance per Ft*	Impedance of 100 Ft Mechanical Fault Path	Soare's Maximum Recommended Fault Path Impedance
14	.00257Ω	.00671Ω	.214Ω	.933Ω
12	.00162Ω	.00617Ω	.187Ω	0.700Ω
10	.00102Ω	.00647Ω	.184Ω	0.467Ω

*Measured values of steel armor

The mechanical grounding means of the combined metal sheath and grounding conductor provides a suitable grounding means as demonstrated by providing a fault path impedance lower than that recommended by Soare's and by demonstrating that the metal sheath of interlocked armor Type MC cables, of itself, does provide a suitable mechanical grounding means in lengths not exceeding 100 feet.



(Log #4242)

17- 17 - (517-13(a) Exception No. 3): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise as follows:

Exception No. 3: Lighting fixtures more than 7 1/2 ft (2.29 m) above the floor in a patient care area and switches located outside of ~~the~~ a patient vicinity shall ~~not be required to be grounded by an insulated grounding conductor.~~ be permitted to utilize any of the types of equipment grounding conductors included in Sec. 250-118, and any of the wiring methods otherwise permitted for the location by Chapter 3 of this Code.

SUBSTANTIATION: When I cover this exception on the national seminar circuit, I refer to it as the "thanks for nothing" ex-ception. Much to my astonishment, instead of being a mistake, the panel actually confirmed the text as re-flecting the intent in the past cycle. This proposal takes a "thanks for nothing" meaningless exception and converts it to something useful. If the panel rejects this approach in this cycle, I will probably propose re-moving it in the 2005 cycle.

The original substantiation for the existing exception (1995AM, Proposal 17-21a) seems to have been based on a panel response to Proposal 17-21, which attempted to include the light fixtures in the redundant grounding provisions, and which was rejected. This is shown in the comments in the voting. The submitter of Proposal 17-21 came back with Comment 17-16, in which he pointed out that without correlating changes in Section 517-13(b) the change was practically useless. The panel statement that Section 517-13(b) incor-porates by reference the provisions in subsection (a) has no conceivable basis in fact. Section 517-13(b) adds provisions on top of the rules in (a).

We are left with an exception that will allow a steel raceway without a separate grounding conductor in some cases. Any electrical contractor will tell you that the significant installation issue is what wiring method must be installed; the presence or absence of a piece of No. 12 green wire is of negligible importance. In other words, after you install a steel raceway to the switch and the light, congratulations, you can omit a green wire.

This proposal as submitted actually accomplishes something. It preserves the zone where redundant grounding has demonstrated safety value, that is, in the patient vicinity, and it removes those requirements in areas where there isn't any greater exposure than in other occupancies. In addition, by changing "the patient vicinity" to "a patient vicinity" this proposal corrects an error in the Code, whereby on the literal text the switch for a patient's light fixture couldn't go in its own patient vicinity, but it could go in an adjacent patient vicinity. This proposal is a companion to one that makes correlating changes in Section 517-13(b).

PANEL ACTION: Reject.
PANEL STATEMENT: The proposal wording would eliminate one of the basic requirements of the use of a metal raceway system or metal clad cables as nonmetallic wiring methods are included in Chapter 3.

The term "the patient" is used in a collective sense and is consistent with the definition of patient vicinity.

The panel disagrees that redundant grounding has only demonstrated safety value in the patient vicinity. The patient vicinity is only a part of the patient care area. The submitter has not provided substantiation that redundant grounding is not necessary in the whole patient care area.

Refer to panel action and statement on Proposal 17-15.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 3 Clark, Nash, Telecky
EXPLANATION OF NEGATIVE:
BENESH: The proposal should have been accepted in principle and the exception deleted. Acceptance in principle would still meet the intent of the submitter.

(Log #4243)

17- 18 - (517-13(b), Exception (New)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Add the following Exception:

Exception: Wiring that is used to supply or control lighting fixtures more than 7 1/2 ft (2.29 m) above the floor in a patient care area shall be permitted to utilize any of the wiring methods recognized in Chapter 3 of this Code provided all of the following conditions are met:

(a) No portion of the wiring installed in accordance with this exception and located at or below the 7 1/2 ft (2.29 m) level is exposed;

(b) No outlet(s) supplied by such wiring is (are) located at or below the 7 1/2 ft (2.29 m) level in any patient care area; and

(c) No control point(s) supplied by such wiring is (are) located in any patient vicinity.

SUBSTANTIATION: Both Sections 517-13(a) Exception No. 3 and 517-13(b) need to be changed for this rule to really have any effect. The key to these proposals is maintaining the enhanced grounding requirements in place for any likely exposure to patient touch, and the key to that is bringing in the concept of "patient vicinity" here as well as Sec. 517-13(a) Exception No. 3 (defined in Section 517-3).

In a nutshell, if the switch is outside any patient vicinity, and if the wiring method isn't exposed below the 7 1/2-ft level, then any suitable wiring method can be used. Note, however, that the exception (see "b") is written so that the home run from any outlet below 7 1/2 ft in a patient care area must still qualify under the normal redundant grounding provisions of Section 517-13(b). Please refer to the companion proposal on Section 517-13(a) Exception No. 3 for additional substantiation.

PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has introduced the same concept of allowing all Chapter 3 wiring methods as submitter's Proposal 17-17 and, therefore, the panel statement for Proposal 17-17 applies.

Also refer to panel action and statement on Proposal 17-15.

17- 19 - (517-17 and (b)(2) (New)): Reject
SUBMITTER: Randall Kirkman, Energy, IL
RECOMMENDATION: Change the heading of Section 517-17 to "Selective Coordination and Ground Fault Protection".

In 517-17(b), designate the existing paragraph as (1) and add the following:

(2) The service and feeder overcurrent devices shall be fully selective such that the feeder device and not the service device shall open on all phase-to-phase, phase-to-neutral, or three-phase faults on the load side of the feeder device.

SUBSTANTIATION: The existing paragraph assures selective coordination for faults to ground only. It is just as critical to be selectively coordinated for phase-to-phase, phase-to-neutral, and phase-to-phase-to-phase faults. The paragraph as proposed above, will assure that Health Care Facilities will not lose their service overcurrent device because of any type of fault on the load side of a feeder device. "Ground-Fault Protection" was changed to "Selective Coordination and Ground Fault Protection" to more accurately reflect the subject matter of the revised section.

PANEL ACTION: Reject.
PANEL STATEMENT: 517-17 deals with with ground fault protection, not overcurrent device selectivity. Selectivity of overcurrent devices is a design issue. The submitter has not substantiated that there is a problem that would warrant the need to expand the concept of selectivity to include overcurrent devices.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12

(Log #2341)

17- 21 - (517-17(a) Exception No. 1 and 2 (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add the new Exception(s) after the first paragraph to read:
Exception No 1: Facilities that do not require electrical life support equipment.
Exception No 2: The ground fault protection required by 517-17(a) shall not be required when the service equipment does not serve any occupancy that requires electrical life support equipment.
SUBSTANTIATION: As currently written, this section requires an additional level of Ground Fault Protection for electrical systems that also serve medical facilities (not just hospitals) when served from a service where Ground Fault Protection is required.
This poses several problems.
For instance it is now common to have dental offices (the dental office not having electrical life support equipment) in large shopping malls. It is not unusual for these malls to have requirements for Ground Fault Protection. In a mall (or other facility) if Ground Fault Protection is Required, the feeder for the dental office must have an additional level of Ground Fault Protection. In this example all this would accomplish is the protection of the remainder of the facility from an problem in the dental facility. It does not appear that this was the intent of this section.
In another example, if we use the same dental office in the same mall and require an additional level of Ground Fault Protection in the other feeders as well as this dental office (the dental office not having electrical life support equipment) we now have provided coordination of the devices. Was it the intent to provide this type of coordination in a dental office, or any other facility that falls under the requirements of NEC 517-40, 517-45, and 517-50 that do not require electrical life support equipment?
Hopefully this will clarify that this additional level of ground fault protection was intended to protect facilities that require electrical life support equipment, not dental offices.
The intent of this submittal is not to negate the requirement as written for hospitals or other facilities that require electrical life support equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter raises a significant problem for the continuity of service for a health care facility that is part of a multipurpose building. The proposal, however, does not resolve the problem. See Proposal 17-23 and the panel statement for action to reject.
Continuity of service to a health care facility in a multipurpose building, including those requiring ground fault protection, requires the selective and coordinated treatment of service and all feeders for the entire building and is the jurisdiction of CMP 4 and 10.
517-17 in the current code is appropriate for the free standing healthcare facilities and need not be modified.
The proposal should be submitted to NFPA 99. That document covers performance requirements for health care facilities.

NOT RETURNED: 3 Clark, Nash, Telecky

(Log #3336)

17- 22 - (517-17(a)(1)): Reject
SUBMITTER: Dennis Darling, Ayres, Lewis, Norris and May, Inc.
RECOMMENDATION: Revise text to read as follows:
(1) On the load side of an emergency ~~essential~~ electrical system transfer switch, or...
SUBSTANTIATION: A FPN was added by CMP-17 in the 1993 cycle to express their intent to not allow GFP from preventing generators from supplying the essential electrical system in a health care facility. The FPN was changed to "shall not be installed" in the 1996 cycle to remove the FPN.
GFP is required on substation breakers in a hospital. In a case where a substation breaker supplies the normal side of an equipment ATS that in turn feeds a number of loads through a distribution panel, GFP should be allowed in the distribution panel so that a single equipment load could be tripped by a breaker in the distribution panel with GFP instead of a substation breaker. If the substation breaker is tripped, the ATS will start the generator and transfer the ground fault onto the generator.
PANEL ACTION: Reject.
PANEL STATEMENT: The addition of ground fault interruption on the equipment system introduces the potential for nuisance operation by interrupting the emergency and normal sources to the entire system.

(Log #2342)

17- 23 - (517-17(b) (New)): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 10 for action in Article 240. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Move section (b) to (c), change (c) to (d) and add a new section to be labeled 517-17 (b).
(b) Multiple Occupancy Buildings. Where a health care facility that falls under the requirements of 517-30 through 517-35 is installed in a multiple occupancy building and ground-fault protection is provided for operation of the service disconnecting means as specified by sections 230-95 and 215-10, an additional level of ground-fault protection shall be provided in the next level of feeder disconnecting means downstream towards the load for all occupancies except as listed in 517-17(a)(1), (2), and (3).
SUBSTANTIATION: In a multiple occupancy building that serves health care as well as other occupancies, it does not appear that ground-fault protection is required for the other occupancies.
Example: An oral surgeon is to occupy a suite in a mall or office building. The health care facility requires electrical life support equipment. Per NEC 517-50(c)(1), this facility must comply with sections 517-30 through 35.
In this example ground-fault protection is required for all feeders serving the suite (except as provided in 517-17(a) but it does not appear the ground-fault protection is required for the other occupancies. This seems to have the not so desirable effect of protecting the other occupancies from a fault in the health care facility while no real protection has been afforded the health care

facility from faults in the other occupancies. It does not seem that this was the true intent of the article.

It is the intent of this proposal to protect the health care facility from ground-faults in the other occupancies.

PANEL ACTION: Reject.

PANEL STATEMENT: While the intent of the proposal has merit, the proposed changes would be better addressed in those portions of the code that cover the entire building and that are not limited to health care facilities.

NOT RETURNED: 3 Clark, Nash, Telecky

(Log #1740)

17- 24 - (517-18): Reject

SUBMITTER: Jamie McNamara, Hastings, MN

RECOMMENDATION: Revise as follows:

517-18. General Care Areas

(a).....

(b).....

(c) Pediatric Locations. Fifteen- and 20-ampere, 125-volt receptacles intended to supply patient care areas of pediatric wards, rooms, or areas shall be listed tamper resistant, ~~or~~ shall employ a listed tamper resistant cover or be ground fault circuit interrupter receptacles.

SUBSTANTIATION: GFCI receptacles are as safe or safer than tamper resistant covers on non GFCI protected receptacles. GFCI receptacles are easier to identified than tamper resistant receptacle.

PANEL ACTION: Reject.

PANEL STATEMENT: Ground fault circuit interrupter (GFCI) receptacles have not been evaluated for tamper resistance and do not prevent access to live components within the receptacle. Also they do not provide protection for faults between the grounded and ungrounded conductors.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 3 Clark, Nash, Telecky

(Log #3292)

17- 25 - (517-18): Reject

SUBMITTER: Michael Gorman, Electro-Lock Technologies, Inc.

RECOMMENDATION: Electro-Lock Technologies, Inc. proposes that the language of Section 518-18(c) be clarified to include technology of self-locking, cam operated safety-sockets as set forth in Electro-Lock Technologies, Inc.'s patent No. 5,297,973, dated March 29, 1994.

Electro-Lock Technologies, Inc. proposes the language be modified as follows:

(c) Pediatric Locations. Fifteen- and 20-ampere, 125-volt receptacles intended to supply patient care areas of pediatric wards, rooms, or areas shall be tamper resistant. For the purpose of this section, a tamper resistant receptacle is a receptacle that, by its construction and design, limits improper access to its energized contacts by prohibiting electrical flow until the outlet plug is locked in place, terminating current upon release of the plug and before removal from the socket, and which exposes the user to no electrical current. The cover for such outlets shall be designed so that, upon removal of the cover from the outlet, no exposed element of the outlet shall subject the user to any electrical current by inadvertence or neglect.

SUBSTANTIATION: The submitted proposal to modify the pediatric locations Section of 518-18(c) is aimed at replacing the existing dangers to children by mandating new construction including a locked socket and plug device in all electrical outlets. The clear intention of the present language is to protect children by mandating "tamper resistant" plugs and sockets. Regrettably, that phrase is undefined in this context. The proposed language takes that intent a step further to use readily available technology to limit, so far as is possible, risk or harm to children and others to shock or fire.

The common electrical outlet, even if made "tamper resistant" as suggested by the code, is antiquated technology, and it is the most dangerous part of every home, office, home and care facility in America, and especially in pediatric care facilities. According to the United States Consumer Product Safety Commission, in 1990, electrical plugs, cords, switches and electrical outlets were involved in about 13,000 life threatening residential fires. Each year, ninety deaths result from fires associated with electrical distribution systems in the United States alone. Each time a plug is pushed into a socket, an uncontrolled electrical charge is emitted. That charge often cause dangerous electrical shock to the unwary or causes fires. Often plugs are difficult to seat fully and firmly. Loose or unseated plugs are a major cause of injuries and accidental fires. The very nature of the electrical outlet, with its open slots, invites curious children to poke and prod with paperclips, dimes and other objects. Even if perfectly installed and used with care, the current standard electrical outlet and plug combination is more dangerous than would be tolerated in any new product on the market.

Beneath the plug, there are further, hidden dangers. Remove the outer, protective plate, and you are presented with live, often uninstalled wires. The outlet box and plugs, designed for another age, will surprise any novice that touches the wrong part of the box with severe shock and possibly injury. Any housewife or do-it-yourselfer has seen sparks arcing without protection outside of the socket. That kind of spark exposes the common stuff of a residential home, garage chemicals, old draperies, and other flammable to fire. That spark can also subject curious children, do-it-yourselfers and overworked house workers to intolerable risks. There must be another, safer way.

Electro-Lock Technologies, Inc.'s "Safety Socket" is new and safer technology. The Safety Socket addresses the risks of electrical fire and shock currently associated with our outmoded electrical outlet in two ways. First, with the Safety Socket, the electrical arcing takes place safely inside of the outlet. The socket will not dispense electricity unless uniquely designed Safety Socket plugs are inserted and locked into place. There is no current until the plug is completely seated and locked in by cams, which prevent any fingers or other articles to come in contact with electrical current. At the moment the plug is released from its cams, the current is terminated, before the plug is removed from its housing, preventing a cause of most accidental shocks to common plug and socket users. The advanced patented design of the Safety Socket is engineered to make it virtually impossible for even the most determined child to be shocked or injured by electrical outlets.

The Safety Socket protects the user in a second important way. The internal wiring system of the Safety Socket ends the tangled knot of wires just behind the faceplate. All wiring in the Safety Socket is internal. The worker or do-it-yourselfer will be safer now that the confused tangle of exposed wires has been eliminated; and, all circuitry been housed inside the Safety Socket wall unit. As an additional safety feature, the Safety Socket can be built with ground fault protection, which will protect from accidents involving water.

The need for new technology is urgent. Updated codes should mandate new construction to be safer than ever before. The proposal suggests a safer solution. The National Fire Protection Association (NFPA) mandates safety code for fire safety for all new construction in the United States, as well as much of the developed world. That code will be updated in 2002. The NFPA's stated goal is to increase the safety of occupants by requiring the use of updated technology. The voting members of the NFPA will soon have the opportunity to vote the Safety Socket into the new code. If that choice is made by the NFPA, the children affected by the new outlets will be safer as a direct consequence.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirement of listed tamper resistant receptacles or covers provides a defined level of protection. The submitter has not provided sufficient evidence in the proposal that there are problems with existing tamper resistant receptacles or covers in pediatric locations of hospitals that would necessitate a change of this magnitude. The intent of the present requirement is not to require tamper resistant plugs, just receptacles.

It appears to be inappropriate to mandate a proprietary technology in all pediatric areas of hospitals. The proposed requirement would require all cord connected equipment to be modified to facilitate them being plugged into these types of receptacles.

NFPA regulations 3-3.6 preclude the mandatory use of proprietary technology. However, there is nothing in the code to preclude its use provided it is listed as hospital grade and tamper resistant.

The panel disagrees with the submitter's substantiation. The requirements for tamper resistant receptacles are in the standard for Attachment Plugs and Receptacles - UL 498. The submitter's reference to residential incident data is not applicable to health care facilities.

(Log #2556)

17- 26 - (517-18(a)): Reject
SUBMITTER: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
RECOMMENDATION: Revise as follows:
(a) Patient Bed Location. Each patient bed location shall be supplied by at least two branch circuits, one from the emergency system and one from the normal system. Emergency system receptacles shall be identified and shall also indicate the panelboard and circuit number supplying them. All branch circuits from the normal system shall originate in the same panelboard.
SUBSTANTIATION: Even though this is a general care area, if an emergency should exist and power is lost for some reason, hopefully maintenance personnel can go quickly to the emergency panelboard serving this area and identify the problem that exists.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation of a problem. It is impractical to mandate the identification of all emergency system receptacles. There is nothing in the code that would preclude this identification.
After installation, cover plates are often erroneously relocated during routine redecorating.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1

NOT RETURNED: 3 Clark, Nash, Telecky

(Log #1874)

17- 28 - (517-21): Reject
SUBMITTER: Ric Thomson, Candler Hospital, Engr Dept.
RECOMMENDATION: Revise as follows:
"... shall not be required for receptacles in those patient care areas where...".
Change "critical" to "patient care areas"; this would include "general care areas" in the text.
SUBSTANTIATION: What is the intent of 517-21? Why not include "general care areas" if you want GFI protection at the sinks, but GFI protection on all receptacles within 6 ft of the sink in patient rooms. In 517-21, why do they only mention "critical care areas." General care areas are important also if you are connected to medical equipment.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: 517-21 was added because of the concern of a GFCI interrupting power to life support equipment in a critical care area. Since this type of equipment would not be expected in a general care area, the panel does not believe the exemption from GFCI protection should apply in a general care area.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #420)

17- 29 - (517-30(3) Exception No. 7 (New)): Reject
SUBMITTER: James Silva, St. Luke's Hospital
RECOMMENDATION: Add an exception to 517-30(3) to read as follows:
Exception No. 7: In existing walls and partitions where receptacles, switches, etc are to be added, hospital grade metal clad cable may be fished. The hospital grade metal clad cable shall enter the partition within 8 in. of a junction box where the branch circuit is supplied by a nonflexible metal raceway.
SUBSTANTIATION: Working in a health care facility where patient environments change so rapidly to facilitate use of new equipment and technology, we are constantly requested to supply emergency power to various locations. When this code change was instituted it created a hardship in installing outlets, switches, etc., in old work applications, not only in completing the work but, also the follow up patching of walls or partitions after channeling to allow the installation of nonflexible metal raceways and has raised the cost of adding equipment tremendously. I feel that adding the proposed exception to 517-30(3) will allow added flexibility without compromising the original intent of the article and also render a cost savings without compromising safety.
PANEL ACTION: Reject.
PANEL STATEMENT: Metal clad cable does not provide the mechanical protection required for Emergency system conductors. The intent is to provide a high level of protection for emergency conductors. The panel has chosen to accomplish this by requiring nonflexible metallic raceway systems, MI or in encasement of concrete.
There has been no fact finding information presented to the panel to suggest that metal clad cable has equivalent mechanical protection to the current methods specified.

(Log #CP1702)

17- 30b - (517-30(b)): Accept
SUBMITTER: CMP 17
RECOMMENDATION: Revise 517-30(b) as follows (the change is limited to that shown in legislative format):
(b) General.
x1. Separate Systems. Essential electrical systems for hospitals shall be comprised of two separate systems capable of supplying a limited amount of lighting and power service, which is considered essential for life safety and effective hospital operation during the time the normal electrical service is interrupted for any reason. These two systems shall be the emergency system and the equipment system.
x2. Emergency System. The emergency system shall be limited to circuits essential to life safety and critical patient care. These are designated the life safety branch and the critical branch.
x3. Equipment System. The equipment system shall supply major electrical equipment necessary for patient care and basic hospital operation.
x4. Transfer Switches. The number of transfer switches to be used shall be based on reliability, design, and load considerations. Each branch of the essential electrical system shall be served by one or more transfer switches as shown in Figures 517-30(a) and 517-30(b). One transfer switch shall be permitted to serve one or more branches or systems in a facility with a maximum demand on the essential electrical system of 150 kVA as shown in Figure 517-30(c). FPN: See Standard for Health Care Facilities, NFPA 99-1999: 3-4.3.2, Transfer Switches; 3-4.2.1.4, Automatic Transfer Switch Features; and 3-4.2.1.6, Nonautomatic Transfer Device Features.
5. Other Loads. Loads served by the generating equipment not specifically named in Sections 517-32, 517-33, and 517-34 shall be served by their own transfer switches such that these loads
a. Shall not be transferred if the transfer will overload the generating equipment, and
b. Shall be automatically shed upon generating equipment overloading.
6. Contiguous Facilities. Hospital power sources and alternate power sources shall be permitted to serve the essential electrical systems of contiguous or same site facilities.
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Titles are required for level 1 and 2 section subdivisions.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #4407)

17- 31 - (517-30(b)): Reject
SUBMITTER: Terry Marsh, Centex-Rodgers Construction Co.
RECOMMENDATION: Add new text to read as follows:
(b) In addition to the requirements of Section 517-30(a), in health care facilities where an essential electrical system is required, and an emergency and standby power system, or a stored electrical energy emergency and standby power system is utilized, the testing and acceptable of these systems shall be in accordance with NFPA 110, Standard for Emergency and Standby Power Systems, and NFPA 111, Standard on Stored Electrical Energy Emergency and Standby Power Systems, respectively.
(c) Where stationary combustion engines or gas turbines are used in conjunction with an emergency or standby power system, it shall also comply with the requirements of NFPA 37, Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines.
SUBSTANTIATION: Although Article 517 does a good job of including extracts from NFPA 99, and in turn NFPA 99 includes text from NFPA 110, and refers to NFPA 37, there is no requirement in NFPA 70 to apply NFPA 99, and the reference in NFPA 99 to NFPA 37 is within the scope only, and does not appear to make it a direct requirement.
The FPN, following 517-30(a), tells you that the performance and testing requirements are in NFPA 99, however, since this is in the form of a FPN, it is not a direct requirement.
Since NFPA 70 is almost universally specified on all health care projects, and NFPA 37 and NFPA 110 are not, including them in the requirements of NFPA 70 will enable better enforcement in all health care facilities.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's request is beyond the scope of CMP 17 as the NEC is a construction and installation Code. NFPA 99 specifies performance and testing requirements for health care facilities. Refer to 517-1, the scope section of Article 517.

(Log #3296)

17- 34 - (517-30(c)(3)): Reject
SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn.
RECOMMENDATION: Revise text to read as follows:
(3) Mechanical Protection of the Emergency System. The wiring of the emergency system of a hospital shall be mechanically protected by installation in nonflexible metal raceways, metal sheathed cables, or shall be wired with Type MI cable. Where installed as branch circuit conductors serving patient care areas, the installation shall comply with the requirements of Section 517-13.
SUBSTANTIATION: Armored Cable and Metal Clad cable provide greater mechanical protection than the other Chapter 3 cable wiring methods that are excluded by this section. Metal-sheathed cables are inherently suitable for more severe mechanical environments by virtue of their metallic outer covering. Mechanical Protection of the Emergency System is an appropriate application for metal-sheathed cables.
PANEL ACTION: Reject.
PANEL STATEMENT: The types of metal sheathed cable, armored cable and metal clad cable, mentioned in the submitter's proposal, do not provide the mechanical protection required for Emergency system conductors. The intent is to provide a high level of protection for emergency conductors. The panel has chosen to accomplish this by requiring nonflexible metallic raceway systems, MI or in encasement of concrete.
There has been no fact finding information presented to the panel to suggest that armored cable or metal clad cable has equivalent mechanical protection to the current methods specified.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #3904)

17- 35 - (517-30(c)(3)): Reject
SUBMITTER: James Conrad, Rockbestors-Surprenant Cable Corp.
RECOMMENDATION: Revise text to Section 517-30(c)(3) as follows:
"The wiring of the emergency system of a hospital shall be mechanically protected installation in nonflexible metal raceway, or shall be with Type MI cable. When limited to feeder circuits, Type MC having a welded corrugated sheath shall be permitted. Where installed as branch circuit conductors serving patient care areas, the installation shall comply with the requirements of Section 517-13."
SUBSTANTIATION: Type MC cable having a welded corrugated sheath offers a level of mechanical protection and should be allowed for this use in this (feeder circuit) application.
PANEL ACTION: Reject.
PANEL STATEMENT: Metal clad cable does not provide the mechanical protection required for Emergency system conductors. The intent is to provide a high level of protection for emergency conductors. The panel has chosen to accomplish this by requiring nonflexible metallic raceway systems, MI or in encasement of concrete.
There has been no fact finding information presented to the panel to suggest that metal clad cable has equivalent mechanical protection to the current methods specified.
When there is a listing for this cable and a distinctive Type designation, the cable may be considered if it can be shown to have equivalent mechanical protection.

(Log #3894)

17- 36 - (517-30(c)(3) Exception No. 5): Reject
SUBMITTER: David Dagenals, Dover, NH
RECOMMENDATION: Revise text to read as follows:
Exception No. 5: Flexible metal raceways and cable assemblies shall be permitted to be used in listed prefabricated medical headwalls, listed office furnishings, or where necessary for flexible connection to equipment and devices.
SUBSTANTIATION: This addition would permit the fishing of approved cable assemblies in those areas that are not readily accessible, i.e., preexisting walls. Making this change would be more consistent with Article 518-4 requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not intend to expand the use of flexible metal raceways and cable assemblies beyond the uses presently covered in this section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #1871)

17- 37 - (517-30(c)(3) Exception No. 6 (New)): Reject
SUBMITTER: Ric Thomson, Candler Hospital, Engr Dept.
RECOMMENDATION: Add an exception as follows:
(AC cable)
Exception No. 6: Listed armored cable assemblies can be used to fish branch circuits in existing walls.
SUBSTANTIATION: In existing facilities, it is hard to justify tearing out a section of wall to add one emergency receptacle "ac cable" is an acceptable wiring method, except where emergency circuits are being used. I believe the ac cable would protect the wiring, and meet the intent of the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel does not intend to expand the use of flexible metal raceways and cable assemblies beyond the uses presently covered in this section.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #2343)

17- 38 - (517-30(c)(3) Exception No. 6 (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add a new Exception No. 6 to read:
517-30(c)(3) Exception No. 6: For tap connections to light fixtures as permitted in Section 410-67(c).
SUBSTANTIATION: The present wording for this section will not permit flexible fixture whips to be used on the emergency systems lighting circuits. Some have interpreted Exception No. 5 as permitting this installation. This new proposal, if accepted will give clear guidance on this or if denied will clarify that this installation method was never permitted by the NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: The allowance intended by the proposed exception is already permitted by 517-30(c)(3) Exception No. 5.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #2993)

17- 39 - (517-30(c)(3) Exception No. 6 (New)): Reject
SUBMITTER: James Conrad, Rockbestors-Surprenant Cable Corp.
RECOMMENDATION: Add the following exception to Section 517-30(c)(3):

Exception No. 6: Where emergency feeder circuits are required by the authority having jurisdiction to be protected against potential damage by fire, a fire-resistive cable listed to maintain circuit integrity for a minimum of 2 hours, shall be permitted.

SUBSTANTIATION: Article 517 does not require the emergency circuits of a hospital to be protected against potential damage by fire. (Panel 17 has made it clear that they do not feel fire protection is necessary due to the redundancy and other fire protection features.) However, there is a growing number of state and/or local electrical codes that require emergency system of a hospital to have such "fire" protection. (Reference: Massachusetts, Rhode Island, Southern Nevada, etc.) When emergency systems for hospitals require the protection against potential damage by fire in these jurisdictions, the fire protection requirements must be implemented concurrently with the mechanical protection requirements in Section 517-30(c)(3). In these cases, it has become an industry challenge to meet these dual requirements especially in retrofitting older hospitals with new emergency systems.

The purpose of this proposal is to show the panel that these requirements (fire and mechanical protection) can be fulfilled with various fire resistive cable designs without the specific additional mechanical protection required by Section 517-30(c)(3).

As a reference, a similar need for both fire and mechanical protection exist in the code when addressing the supply wiring for fire pumps. In Section 695-6(b) Circuit Conductors states "...they shall be protected to resist potential damage by fire, structural failure, or operational accident." Although the wording is slightly different, the intent of the code is to provide fire protection as well as mechanical protection to the circuits. One way of providing this protection is by using a listed Electrical Circuit Protective System or more commonly referred to as Fire Resistive Cable.

UL is charged with the responsibility of creating a standard by which wiring systems can be qualified to meet the intent of this article and subsequently list them for this use. UL Subject 1724 entitled Fire Test For Electrical Circuit Protective Systems is the qualifying test for such systems. Once tested and qualified these systems are found in the UL Building Material Directory. Within this directory the following is stated with regard to Fire Resistive Cables, "The ability of the cables to remain electrically functional during a fire exposure and after the impact, erosion and cooling effects of a water hose stream test have been investigated." It is understandable why this statement can be made as the two hour qualification of a cable includes, temperatures as high as 1850°F while the cables are energized at rated voltage. Then, while the cables are nearly at the melting temperature of copper, they are de-energized and the test assembly is subjected to the impact, erosion, and cooling effect of a hose stream exposure. The hose stream is delivered through a 2 1/2-in. hose and discharged through a National Standard Playpipe of corresponding size equipped with a 1 1/8-in. discharge tip of the standard-taper. The hose stream is applied at 30 psi. Through all of this the cable must continue to function.

When addressing the issue of cable survivability in the event of a fire, many conditions must be considered — temperature rise and its effect on the electrical properties of the insulation is most obvious. Other considerations which must be taken into account such as physical integrity, thermal expansion, impact due to fallen debris, along with the impact and thermal shock due to water spray of fire fighting efforts; have the potential to mechanically damage the wiring system. Apparently UL considered these issues when devising the test standard and this attests to the high level of durability inherent in qualified fire rated systems.

It should also be noted that these cables must be installed under the strict guidelines imposed by UL in the Building Material Directory. The cable must be secured to a 2-hour fire rated masonry wall or concrete floor. They must be secured using a minimum 12-gauge strut and heavy-duty clamp. The spacing of these supports must be between 2 and 4 feet on center and properly secured to the fire rated surface. In itself, the very nature of these substantially rugged and secured installation practices will add a level of mechanical protection to the entire feeder system.

It is not the intent of this proposal to challenge or change the mechanical protection requirements found in this section. It is only to gain recognition of "fire resistive cables" when state or local codes require both fire and mechanical protection.

Note: Supporting material available for review at NFPA Headquarters.

PANEL ACTION: Reject.
PANEL STATEMENT: Fire resistivity is not a criteria for the requirements of 517-30(c)(3) which covers requirements for mechanical protection. Such an exception is not appropriate.

In addition there has been no fact finding information presented to the panel to suggest that all listed fire-resistive cable has equivalent mechanical protection to the current methods specified.

17- 45 - (517-34(b)(2), Exception (New)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Add the following Exception after the second paragraph:
Exception: Existing facilities may use a battery lowering device provided the car will return to the first floor and the doors will automatically open.
SUBSTANTIATION: Existing multi-story occupancies may add ambulatory or other care facilities to office buildings, malls shopping centers and so on. Providing throw over to these elevators (provided they are not selected to service to patient, surgical…areas) can be very difficult and costly. This would give an additional level of protection to these elevators while not requiring extensive modifications to the existing elevator equipment.
The intent of this submittal is to still require stand-by power from the stand-by generator to all elevators that serve patient, surgical, obstetrical, and ground floors, but permit other elevators that are not intended to serve these areas to have a means to recall to the first/ground floor.
PANEL ACTION: Reject.
PANEL STATEMENT: The intent of this section of the code is to provide operation of an elevator to access these areas during an outage. The proposed exception would allow lowering of the elevators only.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #CP1724)

17- 46d - (517-43(b) Exception (New)): Accept
SUBMITTER: CMP 17
RECOMMENDATION: Add a new Exception to 517-43(b) to read as follows:
"Exception: For essential electrical systems under 150 kVA, deletion of the time-lag intervals feature for delayed automatic connection to the equipment system shall be permitted."
SUBSTANTIATION: The addition of this exception is necessary to permit the installation of one transfer switch in essential electrical systems under 150 kVA. As the Code now reads a time lag feature would be mandatory thus requiring two transfer switches, one to handle the automatic connections of the emergency system and the second to handle the delayed automatic connections of the equipment system.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

(Log #2345)

17- 47 - (517-50(b)(1)): Reject
SUBMITTER: Mark Ptashkin, City of Phoenix, AZ
RECOMMENDATION: Revise the following by deleting the word that is struck out and replace it with the underlined word.
(1) Task illumination that is related to the safety of life ~~and~~ or is necessary for the safe cessation of procedures.
SUBSTANTIATION: This proposal is an attempt to clarify when standby power is required for task illumination. As presently written the article seems to indicate that task illumination is only required for procedures where the loss of illumination could endanger a patients life and egress (exiting) illumination is required.
Hopefully this submission will show that standby power is required for any procedure that is being performed that must be safely stopped when there is a loss of power to the lighting for that area, even if it does not involve the possible loss of life of a patient. As an example, a dentist who may be doing work ranging from fillings to tooth extraction, standby lighting should be required so that the dentist may safely cease the procedure, not complete it.
PANEL ACTION: Reject.
PANEL STATEMENT: 517-50(b)(1) is an extract from NFPA 99 and is performance related. The submitter should propose these changes to the NFPA 99 committee.

SUBMITTER: CMP 17
RECOMMENDATION: Revise 517-60(a) as follows (the change is limited to that shown in legislative format):
(a) Hazardous (Classified) Location.
x1. Use Location. In a location where flammable anesthetics are employed, the entire area shall be considered to be a Class I, Division 1 location that shall extend upward to a level 5 ft (1.52 m) above the floor. The remaining volume up to the structural ceiling is considered to be above a hazardous (classified) location.
2. Storage Location. Any room or location in which flammable anesthetics or volatile flammable disinfecting agents are stored shall be considered to be a Class I, Division 1 location from floor to ceiling.
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Titles are required for level 1 and 2 section subdivisions.
PANEL ACTION: Accept.

17- 2d - (517-61(a)): Accept
SUBMITTER: CMP 17
RECOMMENDATION: Revise 517-61(a) as follows (the change is limited to that shown in legislative format):
(a) Within Hazardous (Classified) Anesthetizing Locations.
x1. Isolation. Except as permitted in Section 517-160, each power circuit within, or partially within, a flammable anesthetizing location as referred to in Section 517-60 shall be isolated from any distribution system by the use of an isolated power system.
2. Design and Installation. Isolated power system equipment shall be listed for the purpose and the system designed and installed so that it meets the provisions and is in accordance with Part G.
x3. Equipment Operating at More Than 10 Volts. In hazardous (classified) locations referred to in Section 517-60, all fixed wiring and equipment, and all portable equipment, including lamps and other utilization equipment, operating at more than 10 volts between conductors shall comply with the requirements of Sections 501-1 through 501-15 and Sections 501-16(a) and (b) for Class I, Division 1 locations. All such equipment shall be specifically approved for the hazardous atmospheres involved.
4. Extent of Location. Where a box, fitting, or enclosure is partially, but not entirely, within a hazardous (classified) location(s), the hazardous (classified) location(s) shall be considered to be extended to include the entire box, fitting, or enclosure.
5. Receptacles and Attachment Plugs. Receptacles and attachment plugs in a hazardous (classified) location(s) shall be listed for use in Class I, Group C hazardous (classified) locations and shall have provision for the connection of a grounding conductor.
6. Flexible Cord Type. Flexible cords used in hazardous (classified) locations for connection to portable utilization equipment, including lamps operating at more than 8 volts between conductors, shall be of a type approved for extra-hard usage in accordance with Table 400-4 and shall include an additional conductor for grounding.
7. Flexible Cord Storage. A storage device for the flexible cord shall be provided and shall not subject the cord to bending at a radius of less than 3 in. (76 mm).
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Titles are required for level 1 and 2 section subdivisions.
PANEL ACTION: Accept.

17- 47b - (517-61(b)): Accept
SUBMITTER: CMP 17
RECOMMENDATION: Revise 517-61(b) as follows (the change is limited to that shown in legislative format):
(b) Above Hazardous (Classified) Anesthetizing Locations.
1. Wiring Methods. Wiring above a hazardous (classified) location referred to in Section 517-60 shall be installed in rigid metal conduit, electrical metallic tubing, intermediate metal conduit, Type MI cable, or Type MC cable that employs a continuous, gas/vaportight metal sheath.
2. Equipment Enclosure. Installed equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, generators, motors, or other equipment having make-and-break or sliding contacts, shall be of the totally enclosed type or be constructed so as to prevent escape of sparks or hot metal particles.
Exception: Wall-mounted receptacles installed above the hazardous (classified) location in flammable anesthetizing locations shall not be required to be totally enclosed or have openings guarded or screened to prevent dispersion of particles.
3. Luminaires. Surgical and other lighting fixtures shall conform to Section 501-9(b).
Exception No. 1: The surface temperature limitations set forth in Section 501-9(b)(2) shall not apply.
Exception No. 2: Integral or pendant switches that are located above and cannot be lowered into the hazardous (classified) location(s) shall not be required to be explosionproof.
4. Seals. Approved seals shall be provided in conformance with Section 501-5, and Section 501-5(a)(4) shall apply to horizontal as well as to vertical boundaries of the defined hazardous (classified) locations.
5. Receptacles and Attachment Plugs. Receptacles and attachment plugs located above hazardous (classified) anesthetizing locations shall be listed for hospital use for services of prescribed voltage, frequency, rating, and number of conductors with provision for the connection of the grounding conductor. This requirement shall apply to attachment plugs and receptacles of the 2-pole, 3-wire grounding type for single-phase, 120-volt, nominal, ac service.
6. 250 Volt Receptacles and Attachment Plugs Rated 50 and 60 Amperes. ~~Plugs and r~~Receptacles and attachment plugs rated 250-volts, for connection of 50-ampere, and 60-ampere ac medical equipment for use above hazardous (classified) locations shall be arranged so that the 60-ampere receptacle will accept either the 50-ampere or the 60-ampere plug. Fifty-ampere receptacles shall be designed so as not to accept the 60-ampere attachment plug. The attachment plugs shall be of the 2-pole, 3-wire design with a third contact connecting to the insulated (green or green with yellow stripe) equipment grounding conductor of the electrical system.
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Titles are required for level 1 and 2 section subdivisions. Other changes are editorial for consistency.
PANEL ACTION: Accept.

17- 47c - (517-61(c)): Accept
SUBMITTER: CMP 17
RECOMMENDATION: Revise 517-61(c) as follows (the change is limited to that shown in legislative format):
(c) Other-than-Hazardous (Classified) Anesthetizing Locations.
1. Wiring Methods. Wiring serving other-than-hazardous (classified) locations, as defined in Section 517-60, shall be installed in a metal raceway system or cable assembly. The metal raceway system, or cable armor or sheath assembly, shall qualify as an equipment grounding return path in accordance with Section 250-118. Type MC and Type MI cable shall have an outer metal armor or sheath that is identified as an acceptable grounding return path.
Exception: Pendant receptacle constructions that employ at least Type SJO or equivalent flexible cords suspended not less than 6 ft (1.83 m) from the floor shall not be required to be installed in a metal raceway or cable assembly.
2. Receptacles and Attachment Plugs. Receptacles and attachment plugs installed and used in other-than-hazardous (classified) locations shall be listed for hospital use for services of prescribed voltage, frequency, rating, and number of conductors with provision for connection of the grounding conductor. This requirement shall apply to 2-pole, 3-wire grounding type for single-phase, 120-, 208-, or 240-volt, nominal, ac service.
3. 250 Volt Receptacles and Attachment Plugs Rated 50 and 60 Amperes. ~~Plugs and r~~Receptacles and attachment plugs rated 250 volts, for connection of 50-ampere, and 60-ampere ac medical equipment for use in other-than-hazardous (classified) locations shall be arranged so that the 60-ampere receptacle will accept either the 50-ampere or the 60-ampere plug. Fifty-ampere receptacles shall be designed so as not to accept the 60-ampere attachment plug. The attachment plugs shall be of the 2-pole, 3-wire design with a third contact connecting to the insulated (green or green with yellow stripe) equipment grounding conductor of the electrical system.
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Titles are required for level 1 and 2 section subdivisions. Other changes are editorial for consistency.

(Log #2554)

17- 48 - (517-61(c)(1)): Reject
SUBMITTER: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
RECOMMENDATION: Revise as follows:
(1) Wiring serving other-than-hazardous (classified) locations, as defined in Section 517-60, shall be installed in a metal raceway system or cable assembly. The metal raceway system, or cable armor or sheath assembly, shall qualify as an equipment grounding return path in accordance with Section 250-118. Type MC and Type MI cable shall have an outer metal armor or sheath that is identified as an acceptable grounding return path. There shall be a clear and conspicuous sign visible at all times to persons in each area served stating there shall be no flammable inhalation anesthetic agents used in this area. Letters shall be blocktype and at least 1 in. (25.44 mm) in height.
SUBSTANTIATION: In most healthcare facilities, flammable inhalation anesthetic agents are not used anymore, but these agents still do exist, and if they would be used in other-than-hazardous (classified) anesthetizing locations a clear and present danger would exist. Some design engineers still include the wiring design for hazardous (classified) locations to ensure that no hazard will exist regardless of the anesthetizing agent used. Therefore, at least a sign indicating that flammable anesthetizing agents shall not be used in other-than-hazardous (classified) anesthetizing locations should state this clearly and definitively.
PANEL ACTION: Reject.
PANEL STATEMENT: NFPA 99 specifies the safeguards for anesthetizing locations and the designation as well as signage that is required.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #928)

17- 49 - (517-63(f)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Circuits in Anesthetizing Locations. Except as permitted in (e) above, each isolated power circuit within, or partially within, a flammable anesthetizing location as referred to in Section 517-60 shall ~~be isolated from any distribution system supplying other than anesthetizing locations~~ not occupy the same raceway, cable, or enclosure with conductors of other systems.
SUBSTANTIATION: Present wording is somewhat confusing. Reference to "above" is not specific and could include power wiring for (b) or (c). Does "power" mean isolated power? Does "isolated" mean physically or electrically? Is "other-than-anesthetizing locations" intended to mean "other-than-hazardous (classified)" locations? The hyphenated phrase is suspiciously close to terminology of Section 517-60(b).

PANEL ACTION: Reject.
PANEL STATEMENT: Isolated power system is defined in 517-3. Section 517-63(f) requires isolated power systems as described for flammable anesthetizing locations as does 517-61(a)(1).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #929)

17- 50 - (517-64(b)(2)(4), and (c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b)(2) A common low-voltage isolating transformer installed in other-than-hazardous (classified) location, or in an unclassified location, or (b)(4) Common batteries made up of storage cells located in an other-than-hazardous (classified) location, or in an unclassified location.
In (c) add:
(3) Have ungrounded secondaries.
SUBSTANTIATION: Editorial. An other-than-hazardous (classified) location is a specific location defined in Section 517-60(b). Present literal requirements preclude installation above hazardous (classified) locations or in locations not described in Section 517-60(b). If such nonflammable anesthetizing agents rooms are not available what location is suitable?
Subsection (c) appears to assume or intend ungrounded secondaries but is not explicit. "Isolating", "isolating type" transformers commonly describe separate winding type, unrelated to whether the secondary is grounded or ungrounded. These type transformers are included in grounding requirements of Section 250-30.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided substantiation that there is a problem with the present text. The proposed text does not clarify what is currently in the code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15

(Log #CP1707)

17- 50a - (517-73(a)): Accept
SUBMITTER: CMP 17
RECOMMENDATION: Revise 517-73(a) as follows (the change is limited to that shown in legislative format):
(a) Diagnostic Equipment.
1. Branch Circuits. The ampacity of supply branch-circuit conductors and the current rating of overcurrent protective devices shall not be less than 50 percent of the momentary rating or 100 percent of the long-time rating, whichever is greater.
2. Feeders. The ampacity of supply feeders and the current rating of overcurrent protective devices supplying two or more branch circuits supplying X-ray units shall not be less than 50 percent of the momentary demand rating of the largest unit plus 25 percent of the momentary demand rating of the next largest unit plus 10 percent of the momentary demand rating of each additional unit. Where simultaneous biplane examinations are undertaken with the X-ray units, the supply conductors and overcurrent protective devices shall be 100 percent of the momentary demand rating of each X-ray unit.
FPN: The minimum conductor size for branch and feeder circuits is also governed by voltage regulation requirements. For a specific installation, the manufacturer usually specifies minimum distribution transformer and conductor sizes, rating of disconnecting means, and overcurrent protection.
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Titles are required for level 1 and 2 section subdivisions.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #1512)

17- 51 - (517-80): Reject
SUBMITTER: Junior L. Owings, Rep. Oregon Chapter Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text as follows:
517-80. Patient Care Areas. Wiring methods ~~Equivalent insulation and isolation to that~~ required for the electrical distribution systems in patient care areas shall also be the wiring method provided for communications, signaling systems, data system circuits, fire alarm systems, and systems less than 120 volts, nominal.
FPN: An acceptable alternate means of providing isolation for patient/nurse call systems is by the use of nonelectrified signaling, communications, or control devices held by the patient or within reach of the patient.
SUBSTANTIATION: The present wording of "equivalent insulation and isolation" is ambiguous and unclear as to what the intent should be. The revised wording makes it clear that the wiring methods for the communications, signaling, and other such circuits have to be the same as the wiring methods for the power circuits.
PANEL ACTION: Reject.
PANEL STATEMENT: "Equivalent insulation and isolation" is not necessarily intended to limit the wiring methods to those required for the electrical distributions systems in patient care areas. However, there is nothing to prohibit the use of such wiring methods.
A task group has been appointed to review the language for possible clarification.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #CP1708)

17- 51a - (517-160(a)): Accept
SUBMITTER: CMP 17
RECOMMENDATION: Revise 517-160(a) as follows (the change is limited to that shown in legislative format):
(a) Installations.
1. Isolated Power Circuits. Each isolated power circuit shall be controlled by a switch that has a disconnecting pole in each isolated circuit conductor to simultaneously disconnect all power. Such isolation shall be accomplished by means of one or more transformers having no electrical connection between primary and secondary windings, by means of motor generator sets, or by means of suitably isolated batteries.
x2. Circuit Characteristics. Circuits supplying primaries of isolating transformers shall operate at not more than 600 volts between conductors and shall be provided with proper overcurrent protection. The secondary voltage of such transformers shall not exceed 600 volts between conductors of each circuit. All circuits supplied from such secondaries shall be ungrounded and shall have an approved overcurrent device of proper ratings in each conductor. Circuits supplied directly from batteries or from motor generator sets shall be ungrounded, and shall be protected against overcurrent in the same manner as transformer-fed secondary circuits. If an electrostatic shield is present, it shall be connected to the reference grounding point.
3.Equipment Location. The isolating transformers, motor generator sets, batteries and battery chargers, and associated primary or secondary overcurrent devices shall not be installed in hazardous (classified) locations. The isolated secondary circuit wiring extending into a hazardous anesthetizing location shall be installed in accordance with Section 501-4.
x4. Isolation Transformers. An isolation transformer shall not serve more than one operating room except as covered in (a) and (b).
For purposes of this section, anesthetic induction rooms are considered part of the operating room or rooms served by the induction rooms.
a. Induction Rooms. Where an induction room serves more than one operating room, the isolated circuits of the induction room shall be permitted to be supplied from the isolation transformer of any one of the operating rooms served by that induction room.
b. Higher Voltages. Isolation transformers shall be permitted to serve single receptacles in several patient areas where
1. The receptacles are reserved for supplying power to equipment requiring 150 volts or higher, such as portable X-ray units, and
2. The receptacles and mating plugs are not interchangeable with the receptacles on the local isolated power system.

5. Conductor Identification. The isolated circuit conductors shall be identified as follows:
Isolated Conductor No. 1 — Orange
Isolated Conductor No. 2 — Brown
For 3-phase systems, the third conductor shall be identified as yellow. Where isolated circuit conductors supply 125-volt, single-phase, 15- and 20-ampere receptacles, the orange conductor(s) shall be connected to the terminal(s) on the receptacles that are identified in accordance with Section 200-10(b) for connection to the grounded circuit conductor.
6. Wire-Pulling Compounds. Wire-pulling compounds that increase the dielectric constant shall not be used on the secondary conductors of the isolated power supply.
FPN No. 1: It is desirable to limit the size of the isolation transformer to 10 kVA or less and to use conductor insulation with low leakage to meet impedance requirements.
FPN No. 2: Minimizing the length of branch-circuit conductors and using conductor insulations with a dielectric constant less than 3.5 and insulation resistance constant greater than 6100 megohm-meters (20,000 megohm-ft) at 16°C (60°F) reduces leakage from line to ground reducing the hazard current.
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Titles are required for level 1 and 2 section subdivisions.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 3 Clark, Nash, Telecky

(Log #930)

17- 52 - (517-160(a)(1), (3)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise second sentence of (a)(1):
Such isolation shall be accomplished by means of one or more transformers with ungrounded secondaries, having no electrical connection between primary and secondary windings, by means of motor-generator sets or ~~by means of~~ suitably isolated batteries with ungrounded outputs.
Add to (3): The grounding electrode conductor and grounding electrode as specified in Sections 250-30(b) and 250-169 shall not be required.
SUBSTANTIATION: Sections relative to isolated power infer or indicate the secondary (supply source) is ungrounded but are not specific. However, just indicating the circuits/conductors are ungrounded does not specifically require the supply system to be ungrounded. (see Sections 210-10, 215-7 e.g.)
There does not appear to be anything in this article that modifies the requirements of Sections 250-30(b) and 250-169. Those requirements do not appear to be warranted for the limited extent and use of isolated power systems.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel believes that the existing text of 517-160 when taken as a whole adequately describes the requirements for isolated power systems. Section 517-160 specifically modifies the requirements of 250-30(b) and 250-169 in this application.

(Log #2558)

17- 53 - (517-160(a)(6), FPN No. 2): Reject
SUBMITTER: Joseph C. Warren, Joseph C. Warren Electrical Consulting Services
RECOMMENDATION: Revise as follows:
FPN No. 2: Minimizing the length of branch-circuit conductors and using conductor insulations with a dielectric constant less than 3.5 and insulation resistance constant greater than 6100 megohm-meters (20,000 megohm-ft) at 16°C (60°F) reduces leakage from line to ground reducing the hazard current.
Note: XHHW 90°C conductor has been found under proper testing to accomplish this.
SUBSTANTIATION: In my experience in the installation of isolated circuit conductors in hospitals, the design engineers always specify XHHW 90°C-conductors, and these conductors have been tried and proven to properly meet the criteria of FPN No. 2. Also, it is my understanding that the International Committee of Electrical Engineers "ICEE" did perform tests on 90°C conductors and found that they accomplished the technical requirements of FPN No. 2. By inserting the XHHW-90°C in FPN No. 2, it gives electrical inspectors, installers, and design engineers who are not familiar with what conductor insulation to use for isolated circuit conductors, a proper guideline without doing lengthly research to find the right insulation to use for this purpose.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not intended to limit the design options available to the user. The FPN is only there to describe the characteristics desired and not a specific insulation system. For further information refer to NFPA 99-1999, 3-3.2.2.2.

(Log #CP1709)

17- 53a - (517-160(b)): Accept
SUBMITTER: CMP 17
RECOMMENDATION: Revise 517-160(b) as follows (the change is limited to that shown in legislative format):
(b) Line Isolation Monitor.
1. Characteristics. In addition to the usual control and overcurrent protective devices, each isolated power system shall be provided with a continually operating line isolation monitor that indicates total hazard current. The monitor shall be designed so that a green signal lamp, conspicuously visible to persons in each area served by the isolated power system, remains lighted when the system is adequately isolated from ground. An adjacent red signal lamp and an audible warning signal (remote if desired) shall be energized when the total hazard current (consisting of possible resistive and capacitive leakage currents) from either isolated conductor to ground reaches a threshold value of 5 mA under nominal line voltage conditions. The line monitor shall not alarm for a fault hazard of less than 3.7 mA or for a total hazard current of less than 5 mA.
Exception: A system shall be permitted to be designed to operate at a lower threshold value of total hazard current. A line isolation monitor for such a system shall be permitted to be approved with the provision that the fault hazard current shall be permitted to be reduced but not to less than 35 percent of the corresponding threshold value of the total hazard current, and the monitor hazard current is to be correspondingly reduced to not more than 50 percent of the alarm threshold value of the total hazard current.
2. Impedance. The line isolation monitor shall be designed to have sufficient internal impedance such that, when properly connected to the isolated system, the maximum internal current that can flow through the line isolation monitor, when any point of the isolated system is grounded, shall be 1 mA.
Exception: The line isolation monitor shall be permitted to be of the low-impedance type such that the current through the line isolation monitor, when any point of the isolated system is grounded, will not exceed twice the alarm threshold value for a period not exceeding 5 milliseconds.
FPN: Reduction of the monitor hazard current, provided this reduction results in an increased "not alarm" threshold value for the fault hazard current, will increase circuit capacity.
3. Ammeter. An ammeter calibrated in the total hazard current of the system (contribution of the fault hazard current plus monitor hazard current) shall be mounted in a plainly visible place on the line isolation monitor with the "alarm on" zone at approximately the center of the scale.
Exception: The line isolation monitor shall be permitted to be a composite unit, with a sensing section cabled to a separate display panel section on which the alarm or test functions are located.
FPN: It is desirable to locate the ammeter so that it is conspicuously visible to persons in the anesthetizing location.
SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual. Titles are required for level 1 and 2 section subdivisions.
PANEL ACTION: Accept.

ARTICLE 518 — PLACES OF ASSEMBLY

(Log #3227)

15- 11 - (518): Reject

SUBMITTER: James K. Lathrop, Koffel Assoc., Inc.

RECOMMENDATION: Revise the title of Article 518 as follows:

Article 518 — ~~Places of~~ Assembly Occupancies

Revise 518-1 as follows:

518-1. Scope. This article covers all buildings or portions of buildings ~~or structures~~ designed or intended for the ~~assembly~~ gathering together of 100 or more persons for such purposes as deliberation, worship, entertainment, eating, drinking, amusement, awaiting transportation, or similar purposes.

Revise 518-2(a) as follows:

518-2(a) Examples. ~~Places of a~~Assembly occupancies shall include, but not be limited to, the following:

Armories
Assembly halls
Auditoriums
~~Auditoriums within~~
~~Business establishments~~
~~Mercantile establishments~~
~~Other occupancies~~
~~Schools~~
Bowling lanes
~~Church chapels~~
Club rooms
College and university classrooms, 100 persons and over
Conference rooms
Courtrooms
Dance halls
Dining facilities
Drinking establishments
Exhibition halls
Gymnasiums
Mortuary chapels
Multipurpose rooms
Museums
Passenger stations and terminals of air, surface, underground, and marine public transportation facilities
~~Places of awaiting transportation~~
Places of religious worship
Pool rooms
Recreation piers
Restaurants
Skating rinks
Libraries

Also: change “Place of assembly” to “assembly occupancy” in 240-2, 333-4, 336-5(a), 518-3(a), 640-3(e), and 770-21 (2 locations). Do not change it in 700-1 FPN No. 3 since it is not used in the same context and is a good example of why it should be changed in Article 518.

SUBSTANTIATION: While preparing another proposal for a client, I discovered a significant problem with Article 518. This proposal is based on my extensive experience with NFPA 101, Life Safety Code®, and with the U.S. model building codes. It is not submitted on behalf of any client.

The current National Electrical Code does not define “Places of Assembly.” The current scope is way too broad in that most office buildings, in fact most buildings, have 100 or more persons assembled, but not for the purposes associated with an assembly occupancy. (From a literal viewpoint “intended for the assembly of 100 people” appears to be a feat not yet accomplished, cloning maybe, assembly not yet.) The proposed revision is from the definition contained in NFPA 101 and is compatible with most building codes. The threshold used by the NEC of 100 rather than 50 has been maintained, as this is the threshold that has been consistently justified and there appears to be no justification at this time to alter it.

The term structure is not used in NFPA 101 and should not be used here since the definition of building is a structure supporting or sheltering any use or occupancy. This is also consistent with the model building codes.

The list in 518-2 has been modified to be consistent with NFPA 101, Life Safety Code, also. The dispute last code cycle regarding “church chapels” was very much off target. It appears to be beyond any reason that places of religious worship, regardless of size (as long as they are over 100), would not be an assembly occupancy. If the argument that chapels imply a small place of religious worship, what do we do with large facilities? It only applies to structures and, therefore, a graveside ceremony would not be an issue. The list does not include theaters and motion picture theaters as they are regulated in Article 520.

Since auditoriums are covered whether part of another occupancy or not, the list of possible areas that an auditorium could exist within has been deleted, this is consistent with NFPA 101. Dining halls have been maintained although not in NFPA 101. This would be a good addition for NFPA 101. This is an eating establishment that is rarely called a restaurant.

PANEL ACTION: Reject.

PANEL STATEMENT: The NEC does define “Places of Assembly.” They are buildings or portions of buildings or structures designed or intended for the assembly of 100 or more persons anywhere for any reason, except where modified elsewhere by the NEC. If buildings or structures contain physical subdivisions such as room walls or other barriers, the article concerns itself with only those subdivisions containing 100 people or more, and excludes those subdivisions that contain less. A trivial example would be a restroom with 99 versus 101 stalls.

Structures are included because there are Places of Assembly that are open platforms and not enclosed buildings.

Section 518-2(a) contains EXAMPLES of possible Places of Assembly. There are many places on that list that are not under the jurisdiction of Article 518 due to the fact that less than 100 people are involved. There are also many places not on that list that are Places of Assembly because 100 or more people are involved. Section 518-2(a) could be deleted from the Code and the Code would still contain the same requirements.

Per Article 90-1(a), the purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity. The Code deals with any hazards due to the existence and use of electrical equipment.

Possible electrical induced hazards include fire, smoke, toxicity, structured integrity, burns, shocks, explosions, blinding flashes, and electrocutions.

If all electrical equipment was removed from a building there would still be hazards due to such things as fire, smoke, toxicity, structural integrity, plumbing, mechanical, and egress which are addressed by other codes.

Subdivisions of other codes are required for their matrix of issues. The NEC includes subdivisions required for the NEC matrix of issues. The matrix of issues in the codes covering different aspects do not necessarily match. Occupancies in the Life Safety Code were developed for Life Safety Code issues. Places of Assembly were developed for Electrical Code issues.

Per Section 90-1(b), compliance with the Code will result in an installation that is essentially free (not absolutely free) from hazard. This implies an imperfect document, and therefore, risk management. As the risk increases the likelihood of a problem may need to be decreased. The Code Panel has determined that there is sufficient enough increase in risk when 100 people or more are involved to justify reducing the likelihood of a problem with increased restrictions. Furthermore, some areas involve more risky operations again resulting in increased restrictions for that use.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: This proposal recommends harmonization with the Life Safety Code, NFPA 101, the building codes (both model codes and the new International Code) and with the use of English-language terms, and is being rejected in favor of retaining a unique NEC Code-Making Panel 15 view of the world. As explained by the proponent, people are not built (assembled) in “places of assembly”: they merely occupy the spaces, usually of their own volition. Thus, the term occupancy, is used throughout the United States (including Article 220 of the NEC), is excluded from the title of Article 518 and Section 518-1. This is in contrast with the action taken on Proposal 15-1 where the foreign term “luminaire” is incorporated for harmonization purposes.

(Log #CP1501)

15- 11a - (518-2): Accept

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 15

RECOMMENDATION: Delete 518-2(a) and renumber 518-2(b) and (c) accordingly. Retain the current title "518.2 General Classification"

SUBSTANTIATION: No list of examples can be all-inclusive. The existing list of examples has caused confusion and has often been construed as definitive.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 16
NEGATIVE: 2
NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

BURROWS: Examples of Places of Assembly must be retained to aid the user of this code. Deleting this subsection will not help the user to make a distinction between "places of assembly" and buildings or structures designed for more than 100 persons, where an assembly of 100 or more will not occur.

Section 518-2(a) must be retained. It is user friendly to provide examples for the proper application of Article 518. The present text of 518-2(a) is clear in its intent as an example with the phrase "shall include, but not be limited to".

This Panel has received numerous proposals over several code cycles to add or delete "example locations". We must not take the approach that deleting this section will stop future proposals from doing the same. Examples are used throughout this code to provide for a more user friendly document.

FLACH: The text in the 1999 NEC is clear. The title of Section 518-2(a) is Examples. The text reads: "Places of Assembly shall include, but not be limited to, the following:"

I agree that the list is not complete, but it helps to make the Code user friendly.

Add to the list if necessary, but do not remove it.

COMMENT ON AFFIRMATIVE:

VANNICE: When this proposal was first drafted the existing Section (a) had the list deleted but retained some form of the 100-person requirement . Later on it was decided that Section (a) should be deleted in its entirety in the name of redundancy with respect to the Scope. Since then it has been suggested to me that the 100-person requirement may not be enforceable if it only appears in the Scope. If this is so we may need to put the 100-person requirement back in a reconstituted Section (a). I still agree that the list should be deleted.

(Log #931)

15- 12 - (518-3(b)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Temporary Wiring. In exhibition halls used for display booths, as in trade shows, the temporary wiring shall be ~~installed~~ permitted in accordance with Article 305.

(remainder unchanged).

SUBSTANTIATION: Editorial. "Temporary" wiring infers flexible cords and cables, which should be permitted, not mandated.

PANEL ACTION: Reject.

PANEL STATEMENT: Temporary wiring does not infer flexible cords or cables. Article 305 already permits but does not mandate flexible cords and cables. This proposal appears to be more than just an editorial comment.

(Log #478)

15- 13 - (518-3(b), Exception): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: 518-3(b) Exception - revise third sentence as follows:

"A permanent sign shall be attached to the cable tray at intervals not to exceed 7.5 m (25 ft) ~~25 ft (6.1 m).~~"

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

The SI units were corrected to agree with the inch-pound units.

PANEL ACTION: Accept.

NOT RETURNED: 1 Kalbfeld

(Log #2976)

15- 15 - (518-4(a), Exception): Accept

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

SUBMITTER: David H. Kendall, Carlon, Lamson & Sessions

RECOMMENDATION: Revise text to read as follows:

(a) General. The fixed wiring methods shall be metal raceways, flexible metal raceways, nonmetallic raceways encased in not less than 2 in. (50.8 mm) of concrete, Type MI, MC, or AC cable containing an insulated equipment grounding conductor sized in accordance with Table 250-122.

Exception: Fixed wiring methods shall be as provided in:

a. Audio signal processing, amplification, and reproduction equipment — Article 640

b. Communications circuits — Article 800

c. Class 2 and Class 3 remote-control and signaling circuits — Article 725

d. Fire alarm circuits — Article 760

e. Optical Fiber Cables and Raceways — Article 770.

SUBSTANTIATION: This proposal clarifies that the Optical Fiber Cables and Raceways is an acceptable wiring method per Article 770.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15
NEGATIVE: 3
NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

BURROWS: The addition of this new text is in direct conflict with past action of this Panel with respect to the application of ENT. This new text will circumvent the intent of the Panel with respect to allowable installations of ENT which are presently limited to "spaces with finish rating" in 518(c).

Acceptance of this proposal will allow ENT to be used in any manner in any place of assembly where fiber optic cable is installed per 770-6 Exception. I do not believe that this is the intent of the Panel.

FLACH: This proposal allows nonmetallic raceways in Places of Assembly. (See Section 770-6 Exception). I suggest revising item (c) to read: "Optical Fiber Cables in metal raceways - Article 770."

KLEIN: The Panel comment would allow general purpose and standard plenum nonmetallic raceways in places of assembly.

In addition, the support of optical fiber cables within a place of assembly, (or any other occupancy) is not sufficiently addressed in Article 770.

(Log #3245)

15- 16 - (518-4(b) and (c)): Reject

SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council

RECOMMENDATION: Revise text as follows:

518-4. Wiring Methods.

(a) (No changes)

~~(b) Nonrated Construction. Nonmetallic sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire rated construction by the applicable building code.~~

~~FPN: Fire rated construction is the fire resistive classification used in building codes.~~

(~~c~~ b) Spaces with Finish Rating. Nonmetallic-sheathed cable, ~~E~~electrical nonmetallic tubing and rigid nonmetallic conduit shall be permitted to be installed in restaurants, conference and meeting rooms in hotels or motels, dining facilities, and church chapels where:

(1) The nonmetallic-sheathed cable, electrical nonmetallic tubing or rigid nonmetallic conduit is installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

(2) The nonmetallic-sheathed cable, electrical nonmetallic tubing or rigid nonmetallic conduit is installed above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

Nonmetallic-sheathed cable, ~~E~~electrical nonmetallic tubing and rigid nonmetallic conduit are not recognized for use in other space used for environmental air in accordance with Section 300-22(c).

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

SUBSTANTIATION: The wording of Section 518-4(b) is vague and ambiguous at best. Is the intent of this section to prohibit use of wiring methods noted in buildings that are of "protected" construction type such as 5A (Protected Wood Frame), 3A (Protected Ordinary), or 2A/2B (Protected Noncombustible) under the Model Building Codes, and in non-fire rated construction if certain walls in such a building are required to have a fire rating by other section of the building code, even if:

1. These buildings are 3 stories or less in height, complying with Section 336-5(a)?

2. These buildings are 3 stories or less in height and are sprinklered, wherein interior corridor walls and other interior walls and floors can be non-fire rated?

One can design a non-fire rated construction type building under the building codes (or NFPA 101), and because of issues dealing with corridors, tenant spaces, or hazardous areas would require some fire rated walls or floor separations. I could design this same non-fire rated construction type building and sprinkler the building, and all the fire rated wall and floor issues are permitted to be non-fire rated. Under the building codes (or NFPA 101) even in fire rated construction types, when the building is sprinklered, the only fire rated walls would be load bearing walls.

The Electrical Code Handbook's commentary on page 672 is even more confusing trying to explain this bizarre restriction where one side of a storage room can use one type of wiring, but the other side of the storage room adjoining the corridor can not. The plain fact is that there is no technical reason to prohibit the wiring systems in 518-4(b) to non-fire rated construction, or to non-fire rated walls in non-fire rated construction types.

By the time this code proposal is reviewed by the Panel 15 Committee, the rejected report and proposals of the NEC Task Group on NM Cable will have been made available to the Panels. Even though the NEC Technical Correlating Committee rejected the code proposals because of non-consensus on the Task Group, writing the Task Group's Report and the negative comments from the Task Group's Committee Members, everyone can easily "read between the lines." The Task Group could find no technical reasons or fire/life/injury data to support restricting NM Cable above and beyond any other wiring method.

Based on the lack of findings in the NEC Task Group on NM Cable of any hazard with the use and installation of NM Cable, and the submitted report "Type NM Cable Fire Hazard Analysis," prepared by Paul D. Sullivan, P.E., based on fire testing by Dr. Fred Mowrer (Fire Protection Engineering Department, University of Maryland), and a third party review of the Fire Hazard Report by Dr. Fred Clarke (Benjamin/Clarke Associates, Inc.), NM cable is no more hazardous than the use of ENT.

The submitted fire hazard analysis report was based on the original "Fire Hazard Analysis; The Use of ENMT" that was submitted with the 1987 NEC TCR Code Proposal 8-49 (including the 1987 NEC TCD 8-32 and 8-32A) to remove the three story limit for ENMT. The conclusions of this report were (pages 10-11):

1. "Type NM cable will not decrease the level of life safety within a building of any height when located in ceiling and wall spaces separated from the interior of the building by a 15 minute finish rating (i.e. 1/2" thick gypsum wallboard), and on this basis should not arbitrarily be limited to 3 stories in height."

2. "In terms of building firesafety, these results indicate that Type NM Cable, like ENMT (which is not limited to 3 stories by the National Electrical Code), will not contribute to the hazard of a fire when the cable is separated from the interior of the building by a 15 minute finish rating (NFPA 70 Section 331-3(2))."

The deletion of 518-4(b) and the revision of 518-4(c) would be justified based on the work of the NEC Task Group on NM Cable, and the submitted report that is based on actual fire testing of NM Cable and ENT.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: Refer to the panel action and statement on Proposal 15-17.

(Log #4098)

15- 17 - (518-4(b) and (c)): Reject

SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council

RECOMMENDATION: Revise text as follows:

518-4. Wiring Methods.

(a) (No changes)

~~Nonrated Construction. Nonmetallic sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire rated construction by the applicable building code.~~

~~FPN: Fire rated construction is the fire resistive classification used in building codes.~~

(~~c~~) (b) Spaces with Finish Rating. Nonmetallic-sheathed cable, ~~E~~ electrical nonmetallic tubing and rigid nonmetallic conduit shall be permitted to be installed in restaurants, conference and meeting rooms in hotels or motels, dining facilities, and church chapels where:

(1) The nonmetallic-sheathed cable, electrical nonmetallic tubing or rigid nonmetallic conduit is installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

(2) The nonmetallic-sheathed cable, electrical nonmetallic tubing or rigid nonmetallic conduit is installed above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

Nonmetallic-sheathed cable, ~~E~~ electrical nonmetallic tubing and rigid nonmetallic conduit are not recognized for use in other space used for environmental air in accordance with Section 300-22(c).

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

SUBSTANTIATION: The wording of section to 518-4(b) is vague and ambiguous at best. Is the intent of this section to prohibit use of wiring methods noted in buildings that are of "protected" construction type such as 5A (Protected Wood Frame), 3A (Protected Ordinary), or 2A/2B (Protected Noncombustible) under the Model Building Codes, and in non-fire rated construction if certain walls in such a building are required to have a fire rating by other section of the building code, even if:

1. These buildings are 3 stories or less in height, complying with Section 336-5(a)?

2. These buildings are 3 stories or less in height and are sprinklered, wherein interior corridor walls and other interior walls and floors can be non-fire rated?

One can design a non-fire rated construction type building under the building codes (or NFPA 101), and because of issues dealing with corridors, tenant spaces, or hazardous areas would require some fire-rated walls or floor separations. I could design this same non-fire rated construction type building and sprinkler the building, and all the fire-rated wall and floor issues are permitted to be non-fire rated. Under the building codes (or NFPA 101) even in fire-rated construction types, when the building is sprinklered, the only fire-rated walls would be load bearing walls.

The Electrical Code Handbook's commentary on page 675 refers one over to the commentary for Section 518-4 on page 672. The commentary on page 672 is even more confusing trying to explain this bizarre restriction where one side of a storage room can use one type of wiring, but the other side of the storage room adjoining the corridor can not. The plain fact is that there is no technical reason to prohibit the wiring systems in 520-5(b) to non-fire rated construction, or to non-fire rated walls in non-fire rated construction types.

By the time this code proposal is reviewed by the Panel 15 Committee, the rejected report and proposals of the NEC Task Group on NM Cable will have been made available to the Panels. Even though the NEC Technical Correlating Committee rejected the code proposals because of non-consensus on the Task Group, writing the Task Group's Report and the negative comments from the Task Group's Committee Members, everyone can easily "read between the lines." The Task Group could find no technical reasons or fire/life/injury data to support restricting NM Cable above and beyond any other wiring method.

Based on the lack of findings in the NEC Task Group on NM Cable of any hazard with the use and installation of NM Cable, and the submitted report "Type NM Cable Fire Hazard Analysis," prepared by Paul D. Sullivan, P.E., based on fire testing by Dr. Fred Mowrer (Fire Protection Engineering Department, University of Maryland), and a third party review of the Fire Hazard Report by Dr. Fred Clarke (Benjamin/Clarke Associates, Inc.), NM cable is no more hazardous than the use of ENT.

The submitted fire hazard analysis report was based on the original "Fire Hazard Analysis; The Use of ENMT" that was submitted with the 1987 NEC TCR Code Proposal 8-49 (including the 1987 NEC TCD 8-32 and 8-32A) to remove the three story limit for ENMT. The conclusions of this report were (pages 10-11):

1. "Type NM cable will not decrease the level of life safety within a building of any height when located in ceiling and wall spaces separated from the interior of the building by a 15-minute finish rating (i.e., 1/2-in. thick gypsum wallboard), and on this basis should not arbitrarily be limited to 3 stories in height."

2. In terms of building fire safety, these results indicate that Type NM Cable, like ENMT (which is not limited to 3 stories by the National Electrical Code), will not contribute to the hazard of a fire when the cable is separated from the interior of the building by a 15-minute finish rating (NFPA 70, Section 331-3(2)."

The deletion of 518-4(b) and the revision of 518-4(c) would be justified based on the work of the NEC Task Group on NM Cable, and the submitted report that is based on actual fire testing of NM Cable and ENT.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The fire hazard assessment presented does not address a realistic heat input into the NM cable. NM cable is made of plasticized PVC and not rigid PVC, it is not required to be highly fire retarded and would ignite under conditions of fairly low heat input generating a significant amount of heat and potentially spreading the flame beyond the area of origin. Electrical nonmetallic tubing and rigid nonmetallic conduit are made of rigid PVC, which will not ignite unless an intense heat source is applied and continues to be imposed on the raceway, and that is why they are permitted in this section.

Support documentation addresses flammability and toxicity issues as they relate to survivability. However, another issue is protection of the conductors so they don't become the source of ignition. Section 336-6(b) doesn't allow for this - it states "The cable shall be protected from physical damage where necessary . . . " - this proposal would negate that requirement. The thermal barrier required for ENT and RNMC does not necessarily provide this physical protection.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kalbfeld

(Log #3228)

15- 18 - (518-4(c)): Reject

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

SUBMITTER: James K. Lathrop, Koffel Assoc., Inc./Rep. Carlon, Lamson and Sessions

RECOMMENDATION: Revise 518-4(c) as follows:

(c) Spaces with Finish Rating. Electrical nonmetallic tubing and rigid nonmetallic conduit shall be permitted to be installed in club rooms, college and university classrooms, conference and meeting rooms in hotels or motels, courtrooms, drinking establishments, dining facilities, restaurants, mortuary chapels, museums, passenger stations and terminals of air, surface, underground, and marine public transportation facilities, ~~and church chapels,~~ libraries, and places of religious worship where

(1) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

(2) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed above suspended ceilings where the suspended ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

Electrical nonmetallic tubing and rigid nonmetallic conduit are not recognized for use in other space used for environmental air in accordance with Section 300-22(c).

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

SUBSTANTIATION: There is no justification to prohibit the use of electrical nonmetallic tubing and rigid nonmetallic conduit in the additional uses listed. The NFPA 101, Life Safety Code®, that is charged with the protection of life against fire in buildings does not establish any different requirements amongst these types of assembly occupancies. In fact, the scope of the Technical Correlating Committee on Safety to Life establishes that committee as the committee to have primary responsibility for documents on the protection of human life from fire and other circumstances capable of producing similar consequences. The Technical Committee on Assembly Occupancies and Membrane Structures is established as the committee having primary responsibility for documents on protection of human life from fire and other circumstances capable of producing similar consequences in assembly occupancies. Due to the fact that the Life Safety Code does not have different requirements for the uses listed the NEC would have to justify the differences based on electrical safety. Recognizing that the electrical code is also usually used with a building code, it should be noted that the International Building Code (IBC) developed by all three model building code organizations in the United States breaks assembly occupancies into five groups, A-1 through A-5. Of those five groups the current list in 518-4(c) involves two, A-2 and A-3. Since the IBC does not establish different requirements within a use category and uses in both A-2 and A-3 are currently allowed by the NEC, it makes no sense not to allow the additional uses specified.

Several of the additions are due to a recommended change to 518-2 to coordinate the NEC with the Life Safety Code. These include college and university classrooms (100 persons and over), drinking establishments and libraries. These offer no hazard to life due to electrical installations greater than those already on the list do. Not adding these to the list in 518-4(c) would actually extend the prohibition without substantiation.

Without any historical or research data to validate their action, the panel has consistently rejected logical expansion of the list of uses where ENT and RNMC are permitted for assembly occupancies. ENT and RNMC are permitted wiring methods in high-rise buildings; residential occupancies, including board and care facilities; health care facilities; and detention and correctional occupancies. Clearly if they can be used in these occupancies, many of which are defined in place occupancies, fire, smoke, and

toxicity is not an issue. In these occupancies the fire history has been improving over the last several years. Since the mid-1980s the fire history in these occupancies, where ENT and RNMC are permitted, has improved consistently with other occupancies. There has been an approximate 1/3 decrease in the number of fires in occupancies where ENT and RNMC have been permitted for several years which is consistent with the decrease in the number of fires overall (excluding 1- and 2-family dwellings). (This is based on the NFPA annual fire loss report in the September/October issue each year in the NFPA Journal. The categories of stores and offices, apartments, and institutional were used to represent typical occupancies that ENT and RNMC are permitted to be used in.) If ENT and RNMC were a problem it would have shown up either in the statistics or in litigation, neither of which has occurred.

A review of previous panel substantiations for not permitting ENT or RNMC in similar applications has not revealed any technical rationale for the prohibition. The rejection of Proposal 15-29 during the last code cycle was based on a substantiation that lacked any technical merit. Electrical wiring methods do not behave differently because they are in assembly occupancy. Most other occupancies can have many more than 100 people in them and ENT and RNMC is permitted. The Life Safety Code and the model building codes address the problems of people being unfamiliar with their surroundings, which is a key element in assembly occupancies. There is no valid reason to prohibit ENT or RNMC in the proposed listed uses.

PANEL ACTION: Reject.

PANEL STATEMENT: The substantiation does not provide technical merit or data to expand the uses already permitted.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 15

NEGATIVE: 3

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

AMOS: I am voting against the Panel Action to reject this proposal.

Nonmetallic tubing and rigid nonmetallic conduit is already allowed in a myriad of locations that meet the same criteria as the submitter suggests. Other proposals call for eliminating the reference to particular occupancies because there can never be a "complete" list of occupancies. If the list of examples in 518-2(a) are deleted, there would no longer be a need to list examples in 518-4(c) which would make the rejection a moot point. To reject this proposal on the basis that the proposer did not provide technical data, is really an injustice to the submitter. There is no need to provide any additional data that has not already been presented to the Panel over the years. This is a wiring method that is tried and tested since the early 80's with no negative impact on life or property. This is conduit installed behind a 15-minute finish rated wall, in a room where combustible materials are abundant. How could the use of nonmetallic conduit possibly be considered to be objectionable? To follow the Panel's substantiation: "The Panel, does not provide any technical date to support not expanding its use".

The Panel incorporated 19 separate proposals into rewriting the article to be more user friendly and to comply with the Style Manual. However, we maintained our clearance requirements regarding our overhead distribution.

GLENN: I am voting against the panel action to reject this proposal. The panel's statement that the substantiation does not provide technical merit or data to expand the use of ENT and RNMC to these other venues does not follow good reason. The submitter's substantiation showed that the NFPA Annual Fire Loss Report indicates that in the locations where ENT and RNC are now used there has been a decrease not an increase in fires. If this is the case, what is our reason for not allowing ENT and RNMC to be used in a location that is protected with a 15-minute finish rating?

ENT and RNMC are listed for these types of applications. Fire records show no increase in fire related problems in areas that now use ENT and RNMC. These materials have been in use for over 25 years. In these applications, these materials are required to be covered by 2 in. of concrete or behind a fire rated wall. These are just some of the reasons to accept this proposal.

HIRSCHLER: No evidence exists of fire fatalities resulting from the use of electrical nonmetallic tubing (ENT) or rigid nonmetallic conduit (RNMC) protected by a wall with a 15 min. finish rating. None of these wiring methods are new, they both have a long history of safe use: PVC conduits were introduced in the early 1960's and RNMC was first approved for use in the NEC in 1968, while ENT was first approved in the NEC in 1984.

Furthermore, the panel was already informed in previous cycles that (a) electrical cables installed within ENT can continue to function, when the ENT is installed in code-compliant fashion, even after a fire in the place of assembly has reached flashover; (b) ENT meets the physical property requirements of NEMA and UL for listing for this application, in terms of crushing resistance, impact resistance and tensile and (c) both ENT and RNMC have been safely used for 9 years in the Reedy Creek Improvement District. It has also been shown earlier that the use of nonmetallic raceways (electrical nonmetallic tubing (ENT) and rigid nonmetallic conduit (RNMC) in the occupancies allowed by the code, with the protection required by the code, does not introduce any significant additional hazard to the occupants, or hinder escape in any way. In all the occupancies mentioned in the code there is extra protection, in terms of means of egress, already provided by the model building codes.

Moreover, the fire load (as represented by the combustible materials and products in the room) in places of assembly includes seating for the attendance (which is intended for 100 or more persons). Thus, it is likely that at least 5,000 pounds (100 times a 50 pound seat) of combustible material, of high flammability (since there are no mandatory requirements of fire performance of seating), is present in the assembly room. The fire resulting from ignition of this mass of combustibles vastly exceeds the potential contribution of a few pounds of nonmetallic conduit installed behind a half inch gypsum board wall.

The standard material used in ENT and in RNMC is unplasticized poly(vinyl chloride) (unplasticized PVC), which is of very low combustibility. In fact, unplasticized poly (vinyl chloride) (unplasticized PVC), which is of very low combustibility. In fact, unplasticized PVC will only burn when subjected to intense heat or flame and will cease burning as soon as the source of heat or flame is withdrawn from its vicinity. In terms of fire hazard, the key question is: "How big is the fire?" The answer is given by the maximum heat release rate. A burning object will spread a fire to nearby products only if its gives off enough heat to ignite them. Moreover, the heat has to be released fast enough not to be dissipated or lost while traveling through the cold air surrounding anything not on fire. The rate of heat release has been shown to be much more important than either ease of ignition, smoke toxicity or flame spread in controlling the time available for potential victims of a fire to escape. The maximum rate of heat released by unplasticized PVC when it burns is smaller than that of almost any nonmetallic material, and is indistinguishable from the heat released by the ignition source itself in many cases. The addition of PVC rigid nonmetallic conduit and electrical nonmetallic conduit in concealed spaces does not add any significant fire hazard to such spaces, due to the excellent fire performance of PVC and the good history of safe use of the product.

It is informative to compare the rate of heat release of unplasticized PVC (material used to make electrical nonmetallic tubing ro rigid nonmetallic conduit) with that of the polyurethane foam typically used as the resilient material in an auditorium seat (when considering equal areas):

Product	Conduit PVC	Chair Polyurethane Foam
Incident Heat Flux: 20 kW/m^2		
Peak rate of heat release	50-100 kW/m^2	250-300 kW/m^2
Incident Heat Flux: 40 kW/m^2		
Peak rate of heat release	120-180 kW/m^2	700-750 kW/m^2
Weight of Products	0.1 – 0.2 pounds per foot of raceway	50-100 pounds per seat

This proposal should have been approved, or at least approved in part if the panel believes that there is a specific hazard associated with one or more of the additional uses proposed. The panel statement is inadequate; the panel should have justified why each individual additional occupancy recommended for permitted use of ENMT and RMC is inappropriate for such use. For example it is unclear what additional hazard is associated with university classrooms that is not inherent on other meeting rooms.

COMMENT ON AFFIRMATIVE:

VANNICE: See also Panel Statement to Proposal 15-11.

(Log #2932a)

15- 18a - (519 (New)): Reject

SUBMITTER: Christopher Pharo, Rep. IBEW

RECOMMENDATION: This proposal is to add the following code article.

Article 519. Day-care Facilities.

519-1. Scope. A for profit facility responsible for the maintenance, supervision, and overall well being of children.

519-4. Wiring Methods. Except as modified in this article, wiring methods shall comply with the applicable requirements of Chapters 1 through 4 of this code.

519-6. Grounding of Receptacles and Fixed Electric Equipment.

(a) Childcare Areas. In an area used for the supervision of children, the grounding terminals of all receptacles and all noncurrent carrying conductive surfaces of fixed electric equipment likely to become energized that are subject to personal contact, operating over 100 volts, shall be grounded by an insulated copper conductors. The grounding conductor shall be sized in accordance with Table 250-122 and installed in metal raceways with the branch circuit conductors supplying these receptacles or fixed equipment.

(b) Methods. In addition to the requirements of Section 519-6(a), all branch circuits serving childcare areas shall be provided with a ground path for fault current by installation in a metal raceway system or cable assembly. The metal raceway system, or cable armor or sheath assembly, shall itself qualify as an equipment grounding return path in accordance with Section 250-118.

519-8. Protection.

(a) Childcare Areas. All 15 and 20 ampere, 125 volt receptacles intended to supply childcare areas shall be listed tamper resistant or shall employ a listed tamper resistant cover.

(b) Other Areas. Other areas that contain receptacles and fixed equipment and not intended for childcare shall be considered effectively isolated if lockable door hardware is installed.

519-10. Essential Electrical System.

(a) System Operation. The essential electrical system for these facilities shall be capable of supplying a limited amount of lighting and power. This is considered fundamental in the event of any emergency evacuation that may be needed.

(b) Sources of Power. The essential electrical system must be comprised of either an emergency generator or equipment supplied with an integral battery back-up.

(c) Equipment on the Essential Electrical System.

(1) Illumination of means of egress.

(2) Fire alarm system.

(3) Exit signs.

(4) Elevators.

SUBSTANTIATION: Due to today's economy, both the mother and father must work in order to make ends meet. These families rely on day-care to supervise their children while they are at work. As of this code cycle, these facilities do not fall into any specific category within the NEC. As far as the code is concerned, this facility shall be treated just like any commercial business.

Young children are incapable of self-preservation. Therefore it is up to the NEC to: (1) regulate what wiring methods may be used, (2) determine if an essential electrical system is needed, and (3) protect children from e hazards of electrical devices and equipment. Without this article, or something similar, we continue to place our defenseless children in harms way.

Government and State agencies have already stepped in to regulate exactly who is caring for our children and how they do it. Now is the time for the NEC to rise up and establish minimum safety guidelines for the safe construction and maintenance of day-care facilities.

PANEL ACTION: Reject.

PANEL STATEMENT: Refer to panel action and statement on Proposal 15-18b which address the same issue.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21

VOTE ON PANEL ACTION:

COMMENT ON AFFIRMATIVE:

KRAMER: The reference to 15-55 is a typo, my notes show the correct reference to be 18b, which does address child care facilities, unlike 15-55.

VANNICE: I believe that the proposal referenced in the Panel Statement should be 15-18b, and not 15-55.

(Log #2932)

17- 54 - (519 (New)): Reject

SUBMITTER: Christopher Pharo, Rep. IBEW

RECOMMENDATION: This proposal is to add the following code article.

Article 519. Day-care Facilities.

519-1. Scope. A for profit facility responsible for the maintenance, supervision, and overall well being of children.

519-4. Wiring Methods. Except as modified in this article, wiring methods shall comply with the applicable requirements of Chapters 1 through 4 of this code.

519-6. Grounding of Receptacles and Fixed Electric Equipment.

(a) Childcare Areas. In an area used for the supervision of children, the grounding terminals of all receptacles and all noncurrent carrying conductive surfaces of fixed electric equipment likely to become energized that are subject to personal contact, operating over 100 volts, shall be grounded by an insulated copper conductors. The grounding conductor shall be sized in accordance with Table 250-122 and installed in metal raceways with the branch circuit conductors supplying these receptacles or fixed equipment.

(b) Methods. In addition to the requirements of Section 519-6(a), all branch circuits serving childcare areas shall be provided with a ground path for fault current by installation in a metal raceway system or cable assembly. The metal raceway system, or cable armor or sheath assembly, shall itself qualify as an equipment grounding return path in accordance with Section 250-118.

519-8. Protection.

(a) Childcare Areas. All 15 and 20 ampere, 125 volt receptacles intended to supply childcare areas shall be listed tamper resistant or shall employ a listed tamper resistant cover.

(b) Other Areas. Other areas that contain receptacles and fixed equipment and not intended for childcare shall be considered effectively isolated if lockable door hardware is installed.

519-10. Essential Electrical System.

(a) System Operation. The essential electrical system for these facilities shall be capable of supplying a limited amount of lighting and power. This is considered fundamental in the event of any emergency evacuation that may be needed.

(b) Sources of Power. The essential electrical system must be comprised of either an emergency generator or equipment supplied with an integral battery back-up.

(c) Equipment on the Essential Electrical System.

(1) Illumination of means of egress.

(2) Fire alarm system.

(3) Exit signs.

(4) Elevators.

SUBSTANTIATION: Due to today's economy, both the mother and father must work in order to make ends meet. These families rely on day-care to supervise their children while they are at work. As of this code cycle, these facilities do not fall into any specific category within the NEC. As far as the code is concerned, this facility shall be treated just like any commercial business.

Young children are incapable of self-preservation. Therefore it is up to the NEC to: (1) regulate what wiring methods may be used, (2) determine if an essential electrical system is needed, and (3) protect children from e hazards of electrical devices and equipment. Without this article, or something similar, we continue to place our defenseless children in harms way.

Government and State agencies have already stepped in to regulate exactly who is caring for our children and how they do it. Now is the time for the NEC to rise up and establish minimum safety guidelines for the safe construction and maintenance of day-care facilities.

PANEL ACTION: Reject.

PANEL STATEMENT: The panel does not believe day care facilities warrant a separate Article in the NEC. Any special requirements for day care facilities should be added to the applicable sections of Chapters 1 through 4. A proposal has been made to add a requirement for tamper resistant receptacles to Article 210 for day care facilities and the panel believes that is the

appropriate location for such a requirement. NFPA 101 covers the life safety issues associated with day care facilities.

15- 18b - (519-1 (New)): Reject
NOTE: The following proposal consists of Comment 15-28 on Proposal 15-31 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-31 was:
To have an article titled, Child Care Facilities. To list requirements which child care facilities must follow to ensure the wellbeing of the children.
SUBMITTER: David E. Shapiro, Rep. Safety First Electrical Contracting
RECOMMENDATION: Proposing new text:
526-1. Definition: Child Care Facilities are establishments, or portions of establishments, where children under age twelve are supervised by adults other than their parents, that include provision for naps or sleep, and establishments or portions of establishments where children under age seven are supervised by adults other than their parents in any ratio more demanding than one adult to three children, not counting administrators.
FPN: Child care facilities include, but are not limited to, day care centers, after-school and preschool facilities, whether commercial or not. Authorities having jurisdiction may wish to apply the application of this article to facilities for older children who are disturbed or retarded.
526-2. Layout. Child care facilities shall meet or exceed Code requirements for sleeping areas of hotels.
526-3. Receptacles.
(a) Design. All receptacles permitting ready access shall be Listed as tamper-proof.
(b) Protection. All receptacles in portions of the facility to which children have access, whether or not the receptacles are themselves readily accessibly, shall have GFCI protection.
526-4. Egress. Where 20 or more children are to be present simultaneously, Article 518 shall apply.
526-5. Replacement. Section 526-3 shall apply to replacement of receptacles.
SUBSTANTIATION: GFCI protection will greatly reduce, though not eliminate, injuries due to children sticking objects into readily-accessible receptacles. GFCI protection will reduce, though not eliminate, injuries due to chewing on cords plugged into less accessible receptacles. Where 20 or more young or very young children are served, perhaps, napping, ingress and egress in the case of any emergency can be as much as five times as difficult, and thus warrant the restrictions brought into play with a school or auditorium with 100 adults or older children.
PANEL ACTION: Reject.
PANEL STATEMENT: Comment 15-28 on Proposal 15-31 in the 1998 Annual Meeting NEC Report on Proposals was placed on hold for further study by a task force.
After further research and getting the original proposers backup documentation, it is the opinion of the task force that the NEC is not the place for this type of an article. Childcare facilities are rarely stand-alone facilities, they range from baby sitting neighbors, to church basements, schools, and office complexes, all of which are in existing buildings.
For the most part the facilities are converted classrooms or offices to accommodate a childcare facility where the wiring has already been installed. Our research included discussions with existing childcare facilities operators who agree that the jury is still out on what constitutes “child proof.” Experience has shown that anything out of the ordinary, such as a special cover on a receptacle, becomes an attractive challenge to the inquisitive child. The most problematic aspect of this proposal is enforcement since the majority of these facilities are in existing buildings where the wiring has already been approved by the AHJ.
It is the opinion of the task force that mandating a minimum standard should be left to the childcare licensing agency not the NEC, to make sure the facility is safe for the intended use. The general opinions of the operators interviewed is that the everyday hazards, such as tripping, lead paint, asbestos tiles, electric cords and household products are their main concern.

ARTICLE 520 — THEATERS, AUDIENCE AREAS OF MOTION PICTURE AND TELEVISION STUDIOS, AND SIMILAR LOCATIONS

(Log #480)

15- 19 - (520): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 520-5(a) - revise as follows:
"(a) General. The fixed wiring method shall be metal raceways, nonmetallic raceways encased in at least 50 mm (2 in.) ~~2 in. (50.8 mm)~~ of concrete, Type MI cable, or Type MC cable."
520-42 - last sentence, change "6 in. (152 mm)" to "150 mm (6 in.)"
520-43 - change "No. 20 MSG" to "0.81 mm (0.032 in.)" and change "1/2 in. (12.7 mm)" to "13 mm (_ in.)"
520-47 - change "2 in. (50.8 mm)" to "50 mm (2 in.)"
520-53(a) - change "No. 24 MSG" to "0.51 mm (0.020 in.)"
520-53(h)(2) - change "6 in. (152.4 mm)" to "150 mm (6 in.)" in two places.
520-53(h)(3) - change "10 ft (3.05 m)" to "3.0 m (10 ft)" in two places.
520-53(h)(4) - change "20 ft (6.1 m)" to "6.0 m (20 ft)" in two places.
520-53(h)(4)(e) - change "7 ft (2.13 m)" to "2.1m (7 ft)"
520-53(j) - change "100 ft (30.5 m)" to "30 m (100 ft)" in three places.
520-63(a) - change "18 in. (457 mm)" to "450 mm (18 in.)"
520-68(a)(4)(b) - change "20 ft (6.1 m) to "6.0 m (20 ft)"
520-69(c) - change "3.3 ft (1 m)" to "1.0 m (3.3 ft)"
520-72 - change "8 ft (2.44 m)" to "2.5 m (8 ft)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
MSG is no longer in general use so the equivalent minimum thickness (nominal - tolerance) is being substituted.
PANEL ACTION: Accept.
PANEL STATEMENT: Editorially add "(1/2 in.)" to the line for 520-43 where value in the recomendation is blank.

15- 20 - (520): Accept
SUBMITTER: Kenneth E. Vannice, NSI Corp./Rep. US Inst. for Theater Tech. Engr. Comm.
RECOMMENDATION: This proposal is to change the title of Article 520 to read as follows:
"Theaters, Audience Areas of Motion Picture and Television Studios, Performance Areas, and Similar Locations."
SUBSTANTIATION: Article 525 has been misapplied by authorities having jurisdiction to touring concerts and theater productions in outdoor Performance Areas. This change is required to clarify that Article 520 should be applied to these Performance Areas, and that Article 525 has nothing to do with these areas.
When a temporary stage or performance area is installed outdoors in a stadium or parking lot, it is appropriate to apply the requirements of Article 520 to the installation, which is, in fact, more stringent and different than Article 525 in many areas. This is because the same portable equipment and installation techniques are used in these temporary venues as in a permanent theater or similar location.
There is considerable confusion on the part of the authority having jurisdiction regarding the application of Article 525 to this type of Performance Area. Often, the requirements of Article 525, which are specifically targeted at the requirements of carnivals, fairs, and circuses, are completely at odds with the type of equipment and installation techniques used in a temporary Performance Area. For instance, the GFCI requirements of Article 525 are totally inappropriate for the large phase-control dimming systems in use in Performance Areas. In addition, these areas are installed and operated by qualified personnel, and are not accessible to the general public in the way carnival rides are.
This proposal is related to our proposal to revise Section 520-2.

(Log #4097)

15- 23 - (520-5(a) and (c)): Reject
SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council
RECOMMENDATION: Revise text as follows:
520-5. Wiring Methods.
(a) General.
(1) The fixed wiring method shall be metal raceways, nonmetallic raceways encased in at least 2 in. (50.8 mm) of concrete, Type MI cable, or Type MC cable.
Exception: Fixed wiring methods shall be as provided in Article 640 for audio signal processing, amplification and reproduction

equipment, in Article 800 for communication circuits, in Article 725 for Class 2 and Class 3 remote-control and signaling circuits, and in Article 760 for fire alarm circuits.

(2) Nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings that provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies. When installed above suspended ceilings, the suspended ceilings shall provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

(b) Portable Equipment. (No Changes)

~~(c) Nonrated construction. Nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire-rated construction by the applicable building code.~~

SUBSTANTIATION: The wording of section to 520(c) is vague and ambiguous at best. The wording is identical to the wording used in 518-4(b). Is the intent of this section to prohibit use of wiring methods noted in buildings that are of "protected" construction type such as 5A (Protected Wood Frame), 3A (Protected Ordinary), or 2A/2B (Protected Noncombustible) under the Model Building Codes, and in non-fire rated construction if certain walls in such a building are required to have a fire rating by other section of the building code, even if:

1. These buildings are 3 stories or less in height, complying with Section 336-5(a)?
2. These buildings are 3 stories or less in height and are sprinklered, wherein interior corridor walls and other interior walls and floors can be non-fire rated?

One can design a non-fire rated construction type building under the building codes (or NFPA 101), and because of issues dealing with corridors, tenant spaces, or hazardous areas would require some fire-rated walls or floor separations. I could design this same non-fire rated construction type building and sprinkler the building, and all the fire-rated wall and floor issues are permitted to be non-fire rated. Under the building codes (or NFPA 101) even in fire-rated construction types, when the building is sprinklered, the only fire-rated walls would be load bearing walls.

The Electrical Code Handbook's commentary on page 675 refers one over to the commentary for Section 518-4 on page 672. The commentary on page 672 is even more confusing trying to explain this bizarre restriction where one side of a storage room can use one type of wiring, but the other side of the storage room adjoining the corridor cannot. The plain fact is that there is no technical reason to prohibit the wiring systems in 520-5(b) to non-fire rated construction, or to non-fire rated walls in non-fire rated construction types.

By the time this code proposal is reviewed by the Panel 15 Committee, the rejected report and proposals of the NEC Task Group on NM Cable will have been made available to the Panels. Even though the NEC Technical Correlating Committee rejected the code proposals because of non-consensus on the Task Group, writing the Task Group's Report and the negative comments from the Task Group's Committee Members, everyone can easily "read between the lines." The Task Group could find no technical reasons or fire/life/injury data to support restricting NM Cable above and beyond any other wiring method.

Based on the lack of findings in the NEC Task Group on NM Cable of any hazard with the use and installation of NM Cable, and the submitted report "Type NM Cable Fire Hazard Analysis," prepared by Paul D. Sullivan, P.E., based on fire testing by Dr. Fred Mowrer (Fire Protection Engineering Department, University of Maryland), and a third party review of the Fire Hazard Report by Dr. Fred Clarke (Benjamin/Clarke Associates, Inc.), NM cable is no more hazardous than the use of ENT.

The submitted fire hazard analysis report was based on the original "Fire Hazard Analysis; The Use of ENMT" that was submitted with the 1987 NEC TCR Code Proposal 8-49 (including the 1987 NEC TCD 8-32 and 8-32A) to remove the three story limit for ENMT. The conclusions of this report were (pages 10-11):

1. "Type NM cable will not decrease the level of life safety within a building of any height when located in ceiling and wall spaces separated from the interior of the building by a 15-minute finish rating (i.e., 1/2-in. thick gypsum wallboard), and on this basis should not arbitrarily be limited to 3 stories in height."
2. In terms of building fire safety, these results indicate that Type NM Cable, like ENMT (which is not limited to 3 stories by the National Electrical Code), will not contribute to the hazard of a fire when the cable is separated from the interior of the building by a 15-minute finish rating (NFPA 70, Section 331-3(2)."

The deletion of 520-5(c) and the revision of 520-5(a) would be justified based on the work of the NEC Task Group on NM Cable, and the submitted report that is based on actual fire testing of NM Cable and ENT.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The fire hazard assessment presented does not address a realistic heat input into the NM cable. NM cable is made of plasticized PVC and not rigid PVC, it is not required to be highly fire retarded and would ignite under conditions of fairly low heat input generating a significant amount of heat and potentially spreading the flame beyond the area of origin. Electrical nonmetallic tubing and rigid nonmetallic conduit are made of rigid PVC, which will not ignite unless an intense heat source is applied and continues to be imposed on the raceway, and that is why they are permitted in this section.

Support documentation addresses flammability and toxicity issues as they relate to survivability. However, another issue is protection of the conductors so they don't become the source of ignition. Section 336-6(b) doesn't allow for this - it states "The cable shall be protected from physical damage where necessary . . . " - this proposal would negate that requirement. The thermal barrier required for ENT and RNMC does not necessarily provide this physical protection.

(Log #3294)

15- 24 - (520-5(a)(2)): Accept

SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn.

RECOMMENDATION: Revise text to read as follows:

520-5. Wiring Methods.

(a) General. The fixed wiring method shall be metal raceways, nonmetallic raceways encased in at least 2 in. (50.8 mm) of concrete, ~~Type MI cable, or Type MC cable.~~ Type MI cable, MC cable, or AC cable containing an insulated equipment grounding conductor sized in accordance with Table 250-122.

SUBSTANTIATION: The proposed revision will provide the same wiring methods for Article 520, Theaters, Audience Areas of Motion Picture and Television Studios, and Similar Locations, as is now permitted for Article 518, places of assembly.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

NEGATIVE: 1

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: There has been no substantiation introduced to show that AC cable exhibits the physical integrity that this panel has always required for wiring methods used in theaters. Moreover, AC cable has not been shown to have the same fire safety characteristics of MI cable or MC cable, because of the insulated conductors, which do not have to meet sufficient fire safety requirements.

(Log #4244)

15- 25 - (520-5(d)): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Add the following new subsection (d):

(d) Spaces with Finish Rating. Where this article applies to one or more portions of restaurants, or to conference or meeting rooms in hotels or motels, dining facilities and church chapels, electrical nonmetallic tubing and rigid nonmetallic conduit shall be permitted to be installed in audience seating areas not exceeding 1000 persons under either of the following conditions.

(1) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

(2) The electrical nonmetallic tubing or rigid nonmetallic conduit is installed above suspended ceilings not used as other

space for environmental air as covered in Section 300-22(c). The suspended ceilings shall provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

FPN: A finish rating is established for assemblies containing combustible (wood) supports. The finish rating is defined as the time at which the wood stud or wood joist reaches an average temperature rise of 121°C (250°F) or an individual temperature rise of 163°C (325°F) as measured on the plane of the wood nearest the fire. A finish rating is not intended to represent a rating for a membrane ceiling.

SUBSTANTIATION: In the 1996 Code cycle, and over the figurative dead bodies of the majority of CMP 15 members, the Standards Council placed a more liberal version of this allowance into Article 518. Subsequently, the EC&M Code Forum department was asked if that allowance applied to a meeting room with a stage at one end. We said no to the stage equipment, but yes to the perimeter wiring around the audience seating area. One member of CMP 15 wrote and vehemently objected, so we reconsidered, and then reaffirmed our original conclusion. We didn't think the new rule went into the Code only to be effectively nullified by an incidental stage presence at one end. Most conference facilities and large restaurants have some facilities for stage uses.

The new provision in Sec. 518-2(c), declaring any such audience seating area covered by Article 520, ups the ante considerably. In fact, it is tantamount to circumventing the Council decision. Very few conference facilities with occupancy loads over 100 don't have some sort of stage facility. This proposal restores the status quo ante, by putting the same requirement into Article 520. In response to a helpful conversation with the same CMP 15 member who objected to our original conclusion in the EC&M article, this proposal has been drawn to exclude from coverage very large venues. These inherently involve greater risk and more directly involve a stage focus, with specialized stage equipment likely to be positioned throughout. The 1000 person limit comes from CMP 15's articles, in Section 700-9(d), where it establishes a threshold for enhanced feeder protection.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal seeks to modify Art 520 insofar as it applies to certain Art. 518 venues. The submitter has ignored the qualifications of "Theatrical Areas" in the specific Section 518-2(c) which requires the application of Art. 520, and this would essentially nullify 518-2(c). These Theatrical Areas are "…for the presentation of theatrical or musical productions". This does not apply to a meeting room with a raised platform for a panel or a lecture. Only stages used for these types of productions require the application of Art. 520 to audience seating areas in Art. 518, which clearly excludes the majority of platforms (sometimes referred to as stages) in meeting rooms. These types of productions typically require lower light levels in audience seating areas, higher audience seating density, and the high likelihood of theatrical luminaires and branch circuits over the audience seating area as well as the stage. The "theatrical area " of an Art. 518 occupancy must provide the same level of protection to the audience as that of a theater covered by Art. 520, since the uses are identical. There is no basis for the 1000 person limit in the proposal, since many theaters covered by Art. 520 have much smaller seating capacities than 1000.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

NEGATIVE: 1

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: The proponent made a reasonable suggestion, consistent with the use of ENT and RNMC in Article 518. The panel should have accepted this proposal in part and chosen the occupancy spaces suitable for the use of plastic conduit.

COMMENT ON AFFIRMATIVE:

VANNICE: The submitter seems to believe that the addition of "audience seating areas" to the 1999 Edition of NEC Section 518-2(c) was offered as some form of retaliation. That is far from the truth.

Section 518-2(c) addresses the presence of projection booths, stage platforms or areas for the presentation of theatrical or musical productions. It doesn't address projection systems not requiring a booth (see Article 540), or platforms containing head dinner tables, lecture podiums, panel discussion tables, overhead projector equipment and the like. For the purpose of discussion, I limit this paragraph to portable systems only. Equipment suitable for use in stage and studio applications is greatly different than equipment suitable for general use. Stage and studio equipment is covered by different UL standards, and is excepted to be used under the supervision of specially trained personnel and not the general public. Section 518-2(c) attempts to separate those areas where stage and studio equipment is likely to be used from those areas where general-use equipment is being used. The submitters of the "audience seating areas" clause saw very little difference between a light tower full of stage fixtures wired with portable cord to a stage switchboard on a stage platform, and light towers located in the audience areas with portable cord funning down the aisle areas. It was a case of grounded equipment wired with extra-hard usage cord vs. in some cases ungrounded equipment wired with hard usage or less cord. It was not a case of metallic vs. non-metallic raceway.

Turning now to the fixed equipment case, the issues are similar. It has been stated above the difference between the stage/studio equipment (and other professional equipment) operated by trained personnel and general-use equipment operated by the general public. If a stage in the end of a ballroom is wired to be lit with general-use light track and set up with a wait staff, it is probably not a theatrical venue. If the stage is lit with stage lighting equipment it should be wired like a theatrical venue.

(Log #3748)

15- 26 - (520-11): Reject

SUBMITTER: John H. Schwab, Jr., City of Wauwatosa, WI

RECOMMENDATION: Add new Section 520-11

520-11. Illumination. All illumination, both normal and emergency and for both movie time and intermission shall conform to NFPA 101, Life Safety Code.

SUBSTANTIATION: This would give designers, engineers, and electricians all a place to start from for illumination. Inspectors also have a place of reference to enforce illumination in theaters.

PANEL ACTION: Reject.

PANEL STATEMENT: 1. "Normal" illuminance criteria for any location is not within the scope of either the NEC or the Code for Safety to Life From Fire in Buildings and Structures (NFPA 101).

2. Emergency illuminance criteria is not within the scope of the National Electrical Code. The NEC specifically states in Article 90-1 (c) that it is not intended to be a design specification and in 90-2 (a) that it only covers installations and not the issues of design.

(Log #2519)

15- 29 - (520-53(h)(2)): Accept

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-9. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Richard E. Loyd, Perryville, AR

RECOMMENDATION: Revise as follows:

(2) Single-Conductor Cables. Single-conductor portable supply cable sets shall not be smaller than No. 2 conductors. The equipment grounding conductor shall not be smaller than No. 6 conductor. Single conductor grounded neutral cables for a supply shall be sized as per Section 520-53(o)(2). Where single conductors are paralleled for increased ampacity, the paralleled conductors shall be of the same length and size. Single conductor supply cables shall be grouped together but not bundled. The equipment grounding conductor shall be permitted to be of a different type, provided it meets the other requirements of this section, and it shall be permitted to be reduced in size as permitted by Section 250-122. Grounded (neutral) and equipment grounding conductors shall be identified in accordance with Sections 200-6, 250-134(b), and 310-12. Grounded conductors shall be permitted to be identified by marking at least the first 6 in. (152.4 mm) from both ends of each length of conductor with white ~~or natural gray.~~ Equipment grounding conductors shall be permitted to be identified by marking at least the first 6 in. (152.4 mm) from both ends of each length of conductor with green or green with yellow stripes. Where more than one nominal voltage exists within the same premises, each ungrounded conductor shall be identified by system.

SUBSTANTIATION: This term is undefined. The past Chairman of CMP-5 and others with historical data as to where this term originally came from all relate to products or product manufacturing process that has not been used for the past 35 to 50 years. Since it is a term that was used to define a product no longer made it should be deleted to eliminate the confusion that continues to exist in the industry.

There are many shades of white and many shades of black. How does one determine if gray is a shade of black or white? Different manufacturers use various shades of each color and often two or three different manufacturers wire will be installed on the same job site. The continued use of the term causes confusion and is or could be a safety issue that might result in life threatening shock hazard.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:
AFFIRMATIVE: 16
NEGATIVE: 2
NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: I agree with Mr. Lanni's reason for negative vote.

LANNI: Eliminating the word "natural gray" narrows the color to white. There are variations of white which the natural gray color encompasses that will now become a new issue of confusion. To get pure white a natural PVC needs to have a white color additive. The white insulation discolors in time causing a legal issue and a safety issue that might result in a life threatening shock hazard. If natural gray is confusing, off-white, dirty white or natural white might be a better substitute. Better yet, natural gray could be defined, leaving the code unchanged. What a novel idea!

(Log #4299)

15- 30 - (520-53(h)(2)): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 5-9. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Charles F. Mello, Milwaukie, OR

RECOMMENDATION: Revise text as follows:

(2) Single-Conductor Cables. Single-conductor portable supply cable sets shall not be smaller than No. 2 conductors. The equipment grounding conductor shall not be smaller than No. 6 conductor. Single conductor grounded neutral cables for a supply shall be sized as per Section 520-53(o)(2). Where single conductors are paralleled for increased ampacity, the paralleled conductors shall be of the same length and size. Single conductor supply cables shall be grouped together but not bundled. The equipment grounding conductor shall be permitted to be of a different type, provided it meets the other requirements of this section, and it shall be permitted to be reduced in size as permitted by Section 250-122. Grounded (neutral) and equipment grounding conductors shall be identified in accordance with Sections 200-6, 250-134(b), and 310-12. Grounded conductors shall be permitted to be identified by marking at least the first 6 in. (152.4 mm) from both ends of each length of conductor with white or ~~natural~~ gray. Equipment grounding conductors shall be permitted to be identified by marking at least the first 6 in. (152.4 mm) from both ends of each length of conductor with green or green with yellow stripes. Where more than one nominal voltage exists within the same premises, each ungrounded conductor shall be identified by system.

SUBSTANTIATION: Delete the word natural since the color natural gray is not defined and in fact does not exist as a specified color for wire insulation. This proposal goes with the definition of gray within a specified range of color per the Munsell color system as used by industry for wire color coding. The definition of the gray is provided in another proposal.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter's recommendation would permit gray, a previously permitted ungrounded conductor insulation color, to be used to identify the grounded conductor.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 2
NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: I agree with Mr. Lanni's reason for negative vote.

LANNI: See my Explanation of Negative on proposal 15-29 (Log #4299).

(Log #4245)

15- 31 - (520-53(h)(5)): Reject

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

"Supply conductors ~~not reduced in ampacity~~ shall be permitted to pass through holes in walls specifically designed for the purpose. If penetration is through the fire-resistant–rated wall, it shall be in accordance with Section 300-21. The provisions of Section 520-53(3) and Section 520-53(h)(4) shall not apply to these conductors."

SUBSTANTIATION: Supply conductors could have their ampacity reduced for dozens of reasons that aren't relevant to this application, whether through running in high temperature ambients, or being subject to mutual conductor heating, or having excessive harmonic loading, etc. This proposal eliminates the former vague usage in favor of the exact provisions the 1999 change apparently intended to reference.

PANEL ACTION: Reject.

PANEL STATEMENT: 520-53(h)(5) only applies to portable switchboards. Therefore the other conditions of the submitter's substantiation do not apply.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15
NEGATIVE: 3
NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

KOVACIK: I agree with the negative comments of Mr. Kramer and Mr. Vannice.

KRAMER: The proposal should have been Accepted in Principle, with a change to the wording of 520-53(h)(5) to read:

(5) Supply Conductors Not Reduced in ~~Amapcity~~ Size. Supply conductors not reduced in ~~Amapcity~~size under the provisions of Section 520-53(h)(3) or Section 520-53(h)(4) shall be permitted to pass through holes specifically designed for the purpose. If penetration is through the fire-resistant-rated wall, it shall be in accordance with Section 300-21.

The existing 520-53(h)5 doesn't make a lot of sense; what are "supply conductors not reduced in ampacity"? 520-53(h)3 and 520-(h)4 (the so-called "theater tap rules") allow a short conductor to be increased in ampacity (reduced in size) under stringent conditions. One is the prohibition against the penetration of walls;

however a conductor carrying its normal current may go through a wall. 520-53(h)5 is the place were this is spelled out, but the term 'reduced in amapcity' makes this unclear.

VANNICE: The submitter is correct that "Supply Conductors Not Reduced in Ampacity" is vague unless specifically related to 520-53(h)(3) and 520-53(h)(4) where the term is "...supply conductors shall be permitted to be reduced is size...". In fact, the section is not referring simply to conductors that have had their amapcity lowered (which, as the submitter points out, could happen for a number of reasons including long-run voltage drop compensation), but rather to conductors that are undersized with respect to the overcurrent device that are fed from, under the "tap" rules of 520-53(h)(3) and 520-53(h)(4). The existing wording simply makes no sense under scrutiny.

This proposal should have been Accept in Principle, with a change to the wording of 520-53(h)(5) to read:

(5) Supply Conductors Not Reduced in ~~Ampacity~~ Size "Supply conductors not reduced in ~~ampacity~~ size under the provisions of Section 520-53(h)(3) or Section 520-53(h)(4) shall be permitted to pass through holes...".

(Log #3225)

15- 32 - (520-67): Accept

SUBMITTER: Karl G. Ruling, Entertainment Services and Technology Assn.

RECOMMENDATION: Add text as follows:

"The connector shall be rated in amperes and designed so that differently rated devices cannot be connected together, however, a 20-ampere T-slot receptacle shall be permitted to accept a 15-ampere attachment plug of the same voltage rating. Alternating-current multipole connectors shall be polarized and comply with Sections 410-56(g) and 410-58."

SUBSTANTIATION: The current text prohibits the use of what are commonly called "Edison connectors" on 20A circuits in the theatre. The standard 20A female T-slot Edison connector is designed to allow a 15A male to plug into it, which is prohibited by the current language in 520-67. This has two negative consequences:

1) A readily available, inexpensive, and reasonably rugged connector is prohibited by the NEC, with little or no increase in safety. Contrary to the current prohibition, this 20A connector is commonly used in nonprofessional theatres, and I have seen no evidence that its use has contributed to fires. It certainly is to be preferred over the 15A connector, which also is sometimes used although it too is prohibited on 20A circuits.

2) The current text makes it almost impossible to use any common lamp or appliance in a theatre or the audience area of a motion picture or television studio. These lamps and appliances come with cordsets that use parallel blade connectors designed to plug into 15A slot or 20A T-slot receptacles. It is now customary to use 20A overcurrent protection on stage lighting circuits and convenience outlet circuits. These circuits cannot use the 15A Edison receptacle, per Section 520-9. These circuits also cannot use the 20A T-slot receptacles per the current wording of Section 520-67. Thus, some receptacle that will not accept a 15A male parallel-blade plug must be used on 20A branch circuits, and there is no way to use a vacuum cleaner in an auditorium or a prop table lamp on a stage without modifying the appliance's cordset. Requiring the user to modify an appliance's cordset in order to use the appliance does not enhance safety.

Allowing the use of 20A T-slot connectors in Article 520, as it is allowed in 410-56(i), would enhance safety and eliminate a serious inconvenience.

PANEL ACTION: Accept.

ARTICLE 522 —

(Log #3246)

15- 34 - (522-5(a) and (c)): Reject

SUBMITTER: Ronald G. Nickson, Nat'l Multi Housing Council

RECOMMENDATION: Revise as follows:

522-5. Wiring Methods.

(a) General.

(1) The fixed wiring method shall be metal raceways, nonmetallic raceways encased in at least 2 in. (50.8 mm) of concrete, Type MI cable, or Type MC cable.

Exception: Fixed wiring methods shall be as provided in Article 640 for audio signal processing, amplification and reproduction equipment, in Article 800 for communication circuits, in Article 725 for Class 2 and Class 3 remote-control and signaling circuits, and in Article 760 for fire alarm circuits.

(2) Nonmetallic-sheathed cable, Type AC cable, electrical nonmetallic tubing and rigid nonmetallic conduit shall be permitted to be installed concealed within walls, floors, and ceilings where the walls, floors, and ceilings that provide a thermal barrier of material that has at least a 15 minute finish rating as identified in listings of fire-rated assemblies. When installed above suspended ceilings, the suspended ceilings shall provide a thermal barrier of material that has at least a 15-minute finish rating as identified in listings of fire-rated assemblies.

(b) Portable Equipment. (No changes)

~~(c) Nonrated Construction. Nonmetallic sheathed cable, Type AC cable, electrical nonmetallic tubing, and rigid nonmetallic conduit shall be permitted to be installed in those buildings or portions thereof that are not required to be of fire rated construction by the applicable building code.~~

SUBSTANTIATION: The wording of Section 520(c) is vague and ambiguous at best. The wording is identical to the wording used in 518-4(b). Is the intent of this section to prohibit use of wiring methods noted in buildings that are of "protected" construction type such as 5A (Protected Wood Frame), 3A (Protected Ordinary), or 2A/2B (Protected Noncombustible) under the Model Building Codes, and in nonfire rated construction if certain walls in such a building are required to have a fire rating by other section of the building code, even if:

1. These buildings are 3 stories or less in height, complying with Section 336-5(a)?

2. These buildings are 3 stories or less in height and are sprinklered, wherein interior corridor walls and other interior walls and floors can be nonfire rated?

One can design a nonfire rated construction type building under the building codes (or NFPA 101), and because of issues dealing with corridors, tenant spaces or hazardous areas would require some fire rated walls or floor separations, I could design this same nonfire rated construction type building and sprinkler the building, and all the fire rated wall and floor issues are permitted to be nonfire rated. Under the building codes (or NFPA 101) even in fire rated construction types, when the building is sprinklered, the only fire rated walls would be load bearing walls.

The Electrical Code Handbook's commentary on page 675 refers one over to the commentary for Section 518-4 on page 672. The

commentary on page 672 is even more confusing trying to explain this bizarre restriction where one side of a storage room can use one type of wiring, but the other side of the storage room adjoining the corridor can not. The plain fact is that there is no technical reason to prohibit the wiring systems in 520-5(b) to nonfire rated construction, or to nonfire rated walls in nonfire rated construction types.

By the time this code proposal is reviewed by the Panel 15 Committee, the rejected report and proposals of the NEC Task Group on NM cable will have been made available to the panels. Even though the NEC Technical Correlating Committee rejected the code proposals because of nonconsensus on the Task Group, writing the Task Group's report and the negative comments from the Task Group's committee members, everyone can easily "read between the lines". The Task Group could find no technical reasons or fire/life/injury data to support restricting NM cable above and beyond any other wiring method.

Based on the lack of findings in the NEC Task Group on NM cable of any hazard with the use and installation of NM Cable, and the report "Type NM Cable Fire Hazard Analysis," prepared by Paul D. Sullivan, PE., based on fire testing by Dr. Fred Mowrer (Fire Protection Engineering Department, University of Maryland), and a third party review of the Fire Hazard Report by Dr. Fred Clarke (Benjamin/Clarke Associates, Inc.), NM cable is no more hazardous than the use of ENT.

The fire hazard analysis report was based on the original "Fire Hazard Analysis, The Use of ENMT" that was submitted with the 1987 NEC TCR Code Proposal 8-49 (including the 1987 NEC TCD 8-32 and 8-32A) to remove the three story limit for ENMT. The conclusions of this report were:

1. "Type NM cable will not decrease the level of life safety within a building of any height when located in ceiling and wall spaces separated from the interior of the building by a 15 minute finish rating (i.e., 1/2 in. thick gypsum wallboard), and on this basis should not arbitrarily be limited to 3 stories in height."
2. "In terms of building firesafety, these results indicate that Type NM Cable, like ENMT (which s not limited to 3 stories by the National Electrical Code), will not contribute to the hazard of a fire when the cable is separated from the interior of the building by a 15 minute finish rating (NFPA 70 Section 331-3(2))."

The deletion of 520-5(c) and the revision of 520-5(a) would be justified based on the work of the NEC Task Group on NM Cable, and the report that is based on actual fire testing of NM cable and ENT.

PANEL ACTION: Reject.
PANEL STATEMENT: Refer to panel action and statement on Proposal 15-17.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21
COMMENT ON AFFIRMATIVE:
VANNICE: This proposal appears to change Section 520-5 and not 522-5 as indicated.

ARTICLE 525 — CARNIVALS, CIRCUSES, FAIRS, AND SIMILAR EVENTS

(Log #482)

15- 35 - (525): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 525-12(b) - change "15 ft (4.57 m)" to 4.5 m (15 ft)" in two places.
525-15(a) - change "6 in. (152 mm)" to "150 mm (6 in.)"
525-18(a) - change "12 in. (305 mm)" to "300 mm (12 in.)"
525-30 - change "6 ft (1.83 m)" to "1.8 m (6 ft)"
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:

NOT RETURNED: 1 Kalbfeld

(Log #3385)

15- 36 - (525): Accept in Principle in Part
SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Rearrange Article 525 under the following headings:
A. General Requirements,
B. Power Sources,
C. Power Distribution,
D. Power Utilization, and
E. Grounding and Bonding.
1999 edition to read as follows:
A. General Requirements.
525-1. Scope. This article covers the installation of portable wiring and equipment for carnivals, circuses, exhibitions, fairs, traveling attractions, and similar functions, including wiring in or on all structures.
525-3. Other Articles.
(a) Permanent Structures. Articles 518 and 520 shall apply to wiring in permanent structures.
(b) Portable Wiring and Equipment. Wherever the requirements of other articles of this Code and Article 525 differ, the requirements of Article 525 shall apply to the portable wiring and equipment.
(c) Audio Signal Processing. Amplification, and Reproduction Equipment. Article 640 shall apply to the wiring and installation of audio signal processing, amplification, and reproduction equipment.
(d) Wiring Methods. Unless otherwise provided for in this article, wiring methods shall comply with the applicable requirements of Chapters 1 through 4 of this Code.
(e) Overcurrent Protection. Overcurrent protection of equipment and conductors shall be provided in accordance with Article 240.
(f) Motors. Motors and associated equipment shall be installed in accordance with Article 430.
(g) Attractions Utilizing Pools, Fountains, and Similar Installations with Contained Volumes of Water. This equipment shall be installed to comply with the applicable requirements of Article 680.
525-5. Overhead Conductor Clearances.
(a) Vertical Clearances. Conductors shall have a vertical clearance to ground in accordance with Section 225-18. These clearances shall apply only to wiring installed outside of tents and concessions.
(b) Clearance to Rides and Attractions. Amusement rides and amusement attractions shall be maintained not less than 15 ft (4.57 m) in any direction from overhead conductors operating at 600 volts or less, except for the conductors supplying the amusement ride or attraction. Amusement rides or attractions shall not be located under or within 15 ft (4.57 m) horizontally of conductors operating in excess of 600 volts.
B. Power Sources.
525-10. Separately Derived Systems.
(1) Generators. Generators shall comply with the requirements of Article 445.
(2) Transformers. Transformers shall comply with applicable requirements of Sections 240-3(a), (b)(3), and (c); Section 250-30; and Article 450.
525-11. Services. Services shall be installed in accordance with applicable requirements of Article 230 and, in addition, shall comply with the following.
(1) Guarding. Service equipment shall not be installed in a location that is accessible to unqualified persons, unless the equipment is lockable.
(2) Mounting and Location. Service equipment shall be mounted on a solid backing and be installed so as to be protected from the weather, unless of weatherproof construction.
C. Power Distribution.
525-20. Portable Distribution or Termination Boxes. Portable distribution or termination boxes shall comply with (a) through (d).
(a) Construction. Boxes shall be designed so that no live parts are exposed to accidental contact. Where installed outdoors the box shall be of weatherproof construction and mounted so that the bottom of the enclosure is not less than 6 in. (152 mm) above the ground.
(b) Busbars and Terminals. Busbars shall have an ampere rating not less than the overcurrent device supplying the feeder supplying the box. Where conductors terminate directly on busbars, busbar connectors shall be provided.
(c) Receptacles and Overcurrent Protection. Receptacles shall have overcurrent protection installed within the box. The

overcurrent protection shall not exceed the ampere rating of the receptacle, except as permitted in Article 430 for motor loads.
(d) Single-Pole Connectors. Where single-pole connectors are used, they shall comply with Section 530-22.
525-21. Wiring Methods.
(a) Type. Where flexible cords or cables are used and are not subject to physical damage, they shall be permitted to be listed for hard usage. When used outdoors, flexible cords and cables shall also be listed for wet locations and shall be sunlight resistant.
(b) Single Conductor. Single conductor cable shall be permitted only in sizes No. 2 or larger.
(c) Splices. Flexible cords or cables shall be continuous without splice or tap between boxes or fittings.
(d) Cord Connectors. Cord connectors shall not be laid on the ground unless listed for wet locations. Connectors and cable connections shall not be placed in audience traffic paths or within areas accessible to the public unless guarded.
(e) Support. Wiring for an amusement ride, attraction, tent, or similar structure shall not be supported by any other ride or structure unless specifically designed for the purpose.
(f) Protection. Flexible cords or cables run on the ground, where accessible to the public, shall be covered with approved nonconductive mats. Cables and mats shall be arranged so as not to present a tripping hazard.
D. Power Utilization.
525-25. Wiring Methods.
(a) Open Conductors. Open conductors are prohibited except as part of a listed assembly or festoon lighting installed in accordance with Article 225.
(b) Inside Tents and Concessions. Electrical wiring for temporary lighting, where installed inside of tents and concessions, shall be securely installed, and where subject to physical damage, shall be provided with mechanical protection. All temporary lamps for general illumination shall be protected from accidental breakage by a suitable fixture or lampholder with a guard.
(c) Boxes and Fittings. A box or fitting shall be installed at each connection point, outlet, switchpoint, or junction point.
(d) Disconnecting Means. Each ride and concession shall be provided with a fused disconnect switch or circuit breaker located within sight and within 6 ft (1.83 m) of the operators station. The disconnecting means shall be readily accessible to the operator, including when the rise is in operation. Where accessible to unqualified persons, the enclosure for the switch or circuit breaker shall be of the lockable type. A shunt trip device that opens the fused disconnect or circuit breaker when a switch located in the ride operators console is closed shall be a permissible method of opening the circuit.
525-26. Protection of Electrical Equipment. Electrical equipment and wiring methods in or on rides, concessions, or other units shall be provided with mechanical protection where such equipment or wiring methods are subject to physical damage.
E. Grounding and Bonding.
525-30. General. All system and equipment grounding shall be in accordance with Article 250.
525-31. Equipment. The following equipment connected to the same source shall be bonded:
1. Metal raceways and metal sheathed cable.
2. Metal enclosures of electric equipment. Metal frames and metal parts of rides, concessions, trailers, trucks, or other equipment that contain or support electrical equipment.
525-32. Equipment Grounding Conductor. All equipment requiring grounding shall be grounded by an equipment grounding conductor of a type and size recognized by Section 250-118 and installed in accordance with Article 250. The equipment grounding conductor shall be bonded to the system grounded conductor at the service disconnecting means, or in the case of a separately derived system such as a generator, at the generator or first disconnecting means supplied by the generator. The grounded circuit conductor shall not be connected to the equipment grounding conductor on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means.
525-35. Ground-Fault Circuit-Interrupter Protection for Personnel.
(a) General-Use 15- and 20-Ampere, 125-Volt Receptacles. All 125-volt, single-phase, 15- and 20-ampere receptacle outlets that are in use by personnel shall have listed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be permitted to be an integral part of the attachment plug or located in the power-supply cord, within 12 in. (305 mm) of the attachment plug. For the purposes of this section, listed cord sets incorporating ground-fault circuit-interrupter protection for personnel shall be permitted. Egress lighting shall not be connected to the load side terminals of a ground-fault circuit-interrupter receptacle.
(b) Appliance Receptacles. Receptacles supplying items, such as cooking and refrigeration equipment, which are incompatible with ground-fault circuit-interrupter devices shall not be required to have ground-fault circuit-interrupter protection.
(c) Other Receptacles. Other receptacle outlets not covered in (a) or (b) shall be permitted to have ground-fault circuit-interrupter protection for personnel, or a written procedure shall be continuously enforced at the site by one or more designated persons to ensure the safety of equipment grounding conductors for all cord sets and receptacles, as described in Section 305-6(b)(2).
SUBSTANTIATION: Reorganizing Section 525 is an effort to make it more "user friendly".
PANEL ACTION: Accept in Principle in Part.
PANEL STATEMENT: Refer to the panel action and statement on Proposal 15-37.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Rearrange Article 525 under the following headings:
A. General Requirements.
B. Power Sources.
C. Power Distribution.
D. Power Utilization, and
E. Grounding and Bonding.
1999 Edition to read as follows:
Article 525 — Carnivals, Circuses, Fairs, and Similar Events
A. General Requirements.
525-1. Scope. This article covers the installation of portable wiring and equipment for carnivals, circuses, exhibitions, fairs, traveling attractions, and similar functions, including wiring in or on all structures.
525-3. Other Articles.
(a) Permanent Structures. Articles 518 and 520 shall apply to wiring in permanent structures.
(b) Portable Wiring and Equipment. Wherever the requirements of other articles of this code and Article 525 differ, the requirements of Article 525 shall apply to the portable wiring and equipment.
(c) Audio Signal Processing, Amplification, and Reproduction Equipment. Article 640 shall apply to the wiring and installation of audio signal processing, amplification, and reproduction equipment.
(d) Wiring Methods. Unless otherwise provided for in this article, wiring methods shall comply with the applicable requirements of Chapters 1 through 4 of this code.
(e) Overcurrent Protection. Overcurrent protection of equipment and conductors shall be provided in accordance with Article 240.
(f) Motors. Motors and associated equipment shall be installed in accordance with Article 430.
(g) Attractions Utilizing Pools, Fountains, and Similar Installations with Contained Volumes of Water. This equipment shall be installed to comply with the applicable requirements of Article 680.
525-5. Overhead Conductor Clearances.
(a) Vertical Clearances. Conductors shall have a vertical clearance to ground in accordance with Section 225-18. These clearances shall apply only to wiring installed outside of tents and concessions.
(b) Clearance to Rides and Attractions. Amusement rides and amusement attractions shall be maintained not less than 15 ft (4.57 m) in any direction from overhead conductors operating at 600 volts or less, except for the conductors supplying the amusement ride or attraction. Amusement rides or attractions shall not be located under or within 15 ft (4.57 m) horizontally of conductors operating in excess of 600 volts.
B. Power Sources.

525-10. Separately Derived Systems.
(1) Generators. Generators shall comply with the requirements of Article 445.
(2) Transformers. Transformers shall comply with applicable requirements of Sections 240-3(a), (b)(3) and (c); Section 250-30; and Article 450.
525-11. Services. Services shall be installed in accordance with applicable requirements of Article 230 and, in addition, shall comply with the following.
(1) Guarding. Service equipment shall not be installed in a location that is accessible to unqualified persons, unless the equipment is lockable.
(2) Mounting and Location. Service equipment shall be mounted on a solid backing and be installed so as to be protected from the weather, unless of weatherproof construction.
C. Power Distribution.
525-20. Portable Distribution or Termination Boxes. Portable distribution or termination boxes shall comply with (a) through (d).
(a) Construction. Boxes shall be designed so that no live parts are exposed to accidental contact. Where installed outdoors the box shall be of weatherproof construction and mounted so that the bottom of the enclosure is not less than 6 in. (152 mm) above the ground.
(b) Busbars and Terminals. Busbars shall have an ampere rating not less than the overcurrent device supplying the feeder supplying the box. Where conductors terminate directly on busbars, busbar connectors shall be provided.
(c) Receptacles and Overcurrent Protection. Receptacles shall have overcurrent protection installed within the box. The overcurrent protection shall not exceed the ampere rating of the receptacle, except as permitted in Article 430 for motor loads.
(d) Single-Pole Connectors. Where single-pole connectors are used, they shall comply with Section 530-22.
525-21. Wiring Methods.
(a) Type. Where flexible cords or cables are used and are not subject to physical damage, they shall be permitted to be listed for hard usage. When used outdoors, flexible cords and cables shall also be listed for wet locations and shall be sunlight resistant.
(b) Single Conductor. Single conductor cable shall be permitted only in sizes No. 2 or larger.
(c) Splices. Flexible cords or cables shall be continuous without splice or tap between boxes or fittings.
(d) Cord Connectors. Cord connectors shall not be laid on the ground unless listed for wet locations. Connectors and cable connections shall not be placed in audience traffic paths or within areas accessible to the public unless guarded.
(e) Support. Wiring for an amusement ride, attraction, tent, or similar structure shall not be supported by any other ride or structure unless specifically designed for the purpose.
(f) Protection. Flexible cords or cables run on the ground, where accessible to the public, shall be covered with approved nonconductive mats. Cables and mats shall be arranged so as not to present a tripping hazard.
D. Power Utilization.
525-25. Wiring Methods.
(a) Open Conductors. Open conductors are prohibited except as part of a listed assembly or festoon lighting installed in accordance with Article 225.
(b) Inside Tents and Concessions. Electrical wiring for temporary lighting, where installed inside of tents and concessions, shall be securely installed, and where subject to physical damage, shall be provided with mechanical protection. All temporary lamps for general illumination shall be protected from accidental breakage by a suitable fixture or lampholder with a guard.
(c) Boxes and Fittings. A box or fitting shall be installed at each connection point, outlet, switchpoint, or junction point.
(d) Disconnecting Means. Each ride and concession shall be provided with a fused disconnect switch or circuit breaker located within sight and within 6 ft (1.83 m) of the operators station. The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the enclosure for the switch or circuit breaker shall be of the lockable type. A shunt trip device that opens the fused disconnect or circuit breaker when a switch located in the ride operators console is closed shall be a permissible method of opening the circuit.
525-26. Protection of Electrical Equipment. Electrical equipment and wiring methods in or on rides, concessions, or other units shall be provided with mechanical protection where such equipment or wiring methods are subject to physical damage.
E. Grounding and Bonding.
525-30. General. All system and equipment grounding shall be in accordance with Article 250.
525-31. Equipment. The following equipment connected to the same source shall be bonded:
1. Metal raceways and metal sheathed cable.
2. Metal enclosures of electric equipment.
3. Metal frames and metal parts of rides, concessions, trailers, trucks, or other equipment that contain or support electrical equipment.
525-32. Equipment Grounding Conductor. All equipment requiring grounding shall be grounded by an equipment grounding conductor of a type and size recognized by Section 250-118 and installed in accordance with Article 250. The equipment grounding conductor shall be bonded to the system grounded conductor at the service disconnecting means, or in the case of a separately derived system such as a generator, at the generator or first disconnecting means supplied by the generator. The grounded circuit conductor shall not be connected to the equipment grounding conductor on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means.
525-35. Ground-Fault Circuit-Interrupter Protection for Personnel.
(a) General-Use 15- and 20-Ampere, 125-Volt Receptacles. All 125-volt, single-phase, 15- and 20-ampere receptacle outlets that are in use by personnel shall have listed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be permitted to be an integral part of the attachment plug or located in the power-supply cord, within 12 in. (305 mm) of the attachment plug. For the purposes of this section, listed cord sets incorporating ground-fault circuit-interrupter protection for personnel shall be permitted. Egress lighting shall not be connected to the load side terminals of a ground-fault circuit-interrupter receptacle.
(b) Appliance Receptacles. Receptacles supplying items, such as cooking and refrigeration equipment, which are incompatible with ground-fault circuit-interrupter devices shall not be required to have ground-fault circuit-interrupter protection.
(c) Other Receptacles. Other receptacle outlets not covered in (a) or (b) shall be permitted to have ground-fault circuit-interrupter protection for personnel, or a written procedure shall be continuously enforced at the site by one or more designated persons to ensure the safety of equipment grounding conductors for all cord sets and receptacles, as described in Section 350-6(b)(2).

SUBSTANTIATION: Reorganizing Section 525 is an effort to make it more, "user friendly."

PANEL ACTION: Accept in Principle in Part.

Rearrange Article 525 under the following headings:

A. General Requirements.
B. Power Sources
C. Wiring Methods
D. Grounding and Bonding

Article 525 - Carnivals, Circuses, Fairs, and Similar Events

A. General Requirements.

525-1. Scope. This article covers the installation of portable wiring and equipment for carnivals, circuses, fairs, and similar functions, including wiring in or on all structures.

525-3. Other Articles.

(a) Portable Wiring and Equipment. Wherever the requirements of other articles of this code and Article 525 differ, the requirements of Article 525 shall apply to the portable wiring and equipment.

(b) Permanent Structures. Articles 518 and 520 shall apply to wiring in permanent structures.

(c) Audio Signal Processing, Amplification, and Reproduction Equipment. Article 640 shall apply to the wiring and installation of audio signal processing, amplification, and reproduction equipment.

(d) Attractions Utilizing Pools, Fountains, and Similar Installations with Contained Volumes of Water. This equipment shall be installed to comply with the applicable requirements of Article 680.

525-5. Overhead Conductor Clearances.

(a) Vertical Clearances. Conductors shall have a vertical clearance to ground in accordance with Section 225-18. These clearances shall apply only to wiring installed outside of tents and concessions.

(b) Clearance to Rides and Attractions. Amusement rides and amusement attractions shall be maintained not less than 4.5 m (15 ft.) in any direction from overhead conductors operating at 600 volts or less, except for the conductors supplying the amusement ride or attraction. Amusement rides or attractions

shall not be located under or within 4.5 m (15 ft) horizontally of conductors operating in excess of 600 volts.

525-6. Protection of Electrical Equipment. Electrical equipment and wiring methods in or on rides, concessions, or other units shall be provided with mechanical protection where such equipment or wiring methods are subject to physical damage.

B. Power Sources.

525-10. Separately Derived Systems.

(a) Generators. Generators shall comply with the requirements of Article 445.

(b) Transformers. Transformers shall comply with applicable requirements of Sections 240-3(a), (b)(3) and (c), Section 250-30, and Article 450.

525-11. Services. Services shall be installed in accordance with applicable requirements of Article 230 and, in addition, shall comply with the following.

(a) Guarding. Service equipment shall not be installed in a location that is accessible to unqualified persons, unless the equipment is lockable.

(b) Mounting and Location. Service equipment shall be mounted on a solid backing and be installed so as to be protected from the weather, unless of weatherproof construction.

C. Wiring Methods.

525-20. Wiring Methods.

(a) Type. Where flexible cords or cables are used they shall be listed for extra hard usage. Where flexible cords or cables are used and are not subject to physical damage, they shall be permitted to be listed for hard usage. Where used outdoors, flexible cords and cables shall also be listed for wet locations and shall be sunlight resistant. Extra hard usage flexible cords or cables shall be permitted for use as permanent wiring on portable amusement rides and attractions where not subject to physical damage.

(b) Single-Conductor. Single-conductor cable shall be permitted only in sizes 2 AWG or larger.

(c) Open Conductors. Open conductors are prohibited except as part of a listed assembly or festoon lighting installed in accordance with Article 225.

(d) Splices. Flexible cords or cables shall be continuous without splice or tap between boxes or fittings.

(e) Cord Connectors. Cord connectors shall not be laid on the ground unless listed for wet locations. Connectors and cable connections shall not be placed in audience traffic paths or within areas accessible to the public unless guarded.

(f) Support. Wiring for an amusement ride, attraction, tent, or similar structure shall not be supported by any other ride or structure unless specifically designed for the purpose.

(g) Protection. Flexible cords or cables, where accessible to the public, and where placed on pavement or other hard and smooth surface, shall be permitted to be covered with nonconductive matting, provided that the matting does not constitute a greater trip hazard than the uncovered cables. Flexible cords or cables, where accessible to the public, placed on soft dirt or grass shall be dressed so as to be uncrossed, in a direct line, and separated by one cable diameter. Matting shall not be used to cover cables or cords placed in soft dirt or grass. It shall be permitted to bury cables in a shallow trench. The requirements of Section 300-5 shall not apply.

(h) Boxes and Fittings. A box or fitting shall be installed at each connection point, outlet, switchpoint, or junction point.

525-21. Rides, Tents and Concessions.

(a) Disconnecting Means. Each ride and concession shall be provided with a fused disconnect switch or circuit breaker located within sight and within 1.8 m (6 ft) of the operators station. The disconnecting means shall be readily accessible to the operator, including when the ride is in operation. Where accessible to unqualified persons, the enclosure for the switch or circuit breaker shall be of the lockable type. A shunt trip device that opens the fused disconnect or circuit breaker when a switch located in the ride operators console is closed shall be a permissible method of opening the circuit.

(b) Portable Wiring Inside Tents and Concessions. Electrical wiring for lighting, where installed inside of tents and concessions, shall be securely installed, and where subject to physical damage, shall be provided with mechanical protection. All lamps for general illumination shall be protected from accidental breakage by a suitable fixture or lampholder with a guard.

525-22. Portable Distribution or Termination Boxes. Portable distribution or termination boxes shall comply with (a) through (d).

(a) Construction. Boxes shall be designed so that no live parts are exposed to accidental contact. Where installed outdoors the box shall be of weatherproof construction and mounted so that the bottom of the enclosure is not less than 150 mm (6 in.) above the ground.

(b) Busbars and Terminals. Busbars shall have an ampere rating not less than the overcurrent device supplying the feeder supplying the box. Where conductors terminate directly on busbars, busbar connectors shall be provided.

(c) Receptacles and Overcurrent Protection. Receptacles shall have overcurrent protection installed within the box. The overcurrent protection shall not exceed the ampere rating of the receptacle, except as permitted in Article 430 for motor loads.

(d) Single-Pole Connectors. Where single-pole connectors are used, they shall comply with Section 530-22.

525-23. Ground-Fault Circuit-Interrupter Protection.

(a) Receptacles Requiring GFCI Protection.

(1) General-Use 15- and 20-Ampere, 125-Volt Receptacles. All 125-volt, single-phase, 15- and 20-ampere 20-ampere, NEMA configuration 5-15 and 5-20 receptacles shall have listed ground-fault circuit-interrupter (GFCI) protection. Only those receptacles used during disassembly and reassembly or readily accessible to the general public shall be required to comply.

(2) Other applicable sections. Receptacles which require GFCI protection under other sections, including, but not limited to:

a. 551-40(c)
b. 551-41(c)
c. 680-6
d. 680-41(a)
e. 680-42
f. 680-51(a)
g. 680-56(a)
h. 680-57(b)

(b) Where GFCI protection is not required.

(1) Egress Lighting. Egress lighting shall not be connected to the load side terminals of a ground-fault circuit-interrupter receptacle. Branch circuits which supply egress lighting shall not be protected by a GFCI circuit breaker.

(2) Other Receptacles. Receptacles other than NEMA 5-15 or 5-20 which only facilitate quick and safe disconnecting and reconnecting of electrical equipment shall not be required to have GFCI protection. These receptacle outlets shall be permitted to have GFCI protection.

D. Grounding and Bonding.

525-30. Equipment Bonding. The following equipment connected to the same source shall be bonded:

1. Metal raceways and metal sheathed cable.
2. Metal enclosures of electric equipment.
3. Metal frames and metal parts of rides, concessions, tents, trailers, trucks, or other equipment that contain or support electrical equipment.

525-31. Equipment Grounding. All equipment requiring grounding shall be grounded by an equipment grounding conductor of a type and size recognized by Section 250-118 and installed in accordance with Article 250. The equipment grounding conductor shall be bonded to the system grounded conductor at the service disconnecting means, or in the case of a separately derived system such as a generator, at the generator or first disconnecting means supplied by the generator. The grounded circuit conductor shall not be connected to the equipment grounding conductor on the load side of the service disconnecting means or on the load side of a separately derived system disconnecting means.

525-32. Grounding conductor continuity assurance. The effectiveness of the grounding conductor(s) to reduce electrical shock hazards as required by Sections 210-7(c), 250-114, 250-138, and 305-4(d) shall be tested each time that portable electrical equipment is reconnected.

PANEL STATEMENT: Article 525 was revised to comply with the Manual of Style and to be more user friendly.

The text has been revised to incorporate the panel actions on Proposals:

(Log #3426)

15- 38 - (525-1): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Kenneth E. Vannice, NSI Corp./Rep. US Inst. for Theater Tech. Engr. Comm.
RECOMMENDATION: This proposal is to revise Section 525-1 as follows:
Scope. This Article covers the installation of portable wiring and equipment for carnivals, circuses, ~~exhibitions,~~ fairs, traveling attractions and similar functions including wiring in or on all structures.
SUBSTANTIATION: The deletion of the word "exhibitions" will cause the correct location of this type of event into Article 518. Subsection 518-3(b) mentions exhibition halls "such as trade shows." Since this term has been used in Article 518 for several Code cycles, and no reason has been given to transfer the rules governing exhibitions to Article 525, then this word should be deleted from Article 525's Scope.
PANEL ACTION: Accept.

(Log #3427)

15- 39 - (525-1): Accept
SUBMITTER: Kenneth E. Vannice, NSI Corp./Rep. US Inst. for Theater Tech. Engr. Comm.
RECOMMENDATION: Revise text to read as follows:
Scope. This Article covers the installation of portable wiring and equipment for carnivals, circuses, exhibitions, fairs, ~~traveling attractions,~~ and similar functions including wiring in or on all structures.
SUBSTANTIATION: The term "traveling attractions" has been incorrectly applied to touring musical concerts or theatrical productions which set up temporary performance areas. Due to the type of equipment used and the installation techniques used by these events in the performance area, the more stringent requirements of Article 520 should be applied. The term "traveling attractions" is very vague and undefined, and causes confusion on the part of authorities having jurisdiction to where Article 525 should be applied. This change is needed to clarify that Article 520 should be applied to performance areas, and Article 525 should only be applied to carnivals, circuses, fairs, and similar functions.
During the enforcement phase of the 1996 NEC, at least one instance has been reported where the authority having jurisdiction applied the requirements of Article 525 to an outdoor musical concert venue. The venue included a stage and lighting towers. There was no carnival, fair or circus involved with this specific venue.
PANEL ACTION: Accept.

AFFIRMATIVE: 19
NOT RETURNED: 1 Kalbfeld

(Log #3691)

15- 40 - (525-1): Reject
SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Add text as follows:
Electrical installations which are covered by Section 525 shall be required to comply with the version of the NEC which was in effect when the equipment was built.
SUBSTANTIATION: The majority of electrical installations in other structures are inspected at the time they are built; and reinspected only if a major modification is done which requires a building permit, or reconnection to the utility. The electrical installations at carnivals are inspected and reinspected several times within a year. It becomes an undue financial burden to comply with ever changing electrical codes.
PANEL ACTION: Reject.
PANEL STATEMENT: The equipment needs to comply with the applicable code for safety reasons. The electrical equipment is continually disconnected and reconnected. Cost is insignificant when compared to life safety.

(Log #3692)

15- 42 - (525-13): Reject
SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Insert new paragraphs (e), as follows, and renumber (e) - (g) to (f) - (h).
(e) Repair of flexible cords and cables.
1. Multiconductor cord. Flexible multiconductor cords may be repaired if <u>all</u> of the following criteria are met: 1) the conductors are No. 8 AWG or larger, 2) at least two of the conductors are undamaged, 3) at least 25 percent of the diameter of the outside insulation is undamaged, and 4) the repair will not overlap a previous repair.
The conductors shall be spliced using crimp type splices. The splices shall be staggered along the length of the cord. The splices shall be of the insulated type, or they shall be insulated with heat-shrink tubing.

The outside insulation shall be recovered with heat-shrink tubing of a type which will restore the, "extra-hard usage", properties of the cord.

2. Single-conductor cable. The insulation of single-conductor cable may be repaired with heat-shrink tubing of a type which will restore the, "extra-hard usage", properties of the cable.

Single-conductor cable shall not be spliced.

SUBSTANTIATION: Large gauge cords and cables are very expensive in long lengths. This procedure has proven to effect successful repairs to cords larger than No. 8 AWG, and to cables larger than No. 2 AWG.

PANEL ACTION: Reject.

PANEL STATEMENT: Splices have been prohibited in Article 525 for increased safety. An inspector can not usually verify that the splice or repair has been done correctly.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NEGATIVE: 1

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

DUNN: This proposal could be Accept in Part. If the splicing is objectionable, accept at least the repair of the outside insulation if there is no damage to the conductor(s).

(Log #933)

15- 43 - (525-13(a)): Accept in Principle

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(a) Type. Unless otherwise provided for in this article, wiring methods shall comply with the applicable requirements of Chapters 1 through 4 of this code. Where flexible cords or cables are used ~~and~~ they shall be listed for extra hard usage, except where not subject to physical damage, they shall be permitted to be listed for hard usage. Where ~~When~~ used outdoors, flexible cords and cables shall also be listed for wet locations and be sunlight resistant.

SUBSTANTIATION: The proposed additional sentence restores the wording revised by the panel in Comment 15-45 of the A98 ROC. Without this sentence the permitted use of hard usage cord has no relevance since there is no specific type mandated.

PANEL ACTION: Accept in Principle.

Revise to read as follows:

(a) Type. Unless otherwise provided for in this article, wiring methods shall comply with the applicable requirements of Chapters 1 through 4 of this code. Where flexible cords or cables are used they shall be listed for extra hard usage. Where not subject to physical damage, they shall be permitted to be listed for hard usage. Where ~~When~~ used outdoors, flexible cords and cables shall also be listed for wet locations and be sunlight resistant.

PANEL STATEMENT: The text is revised to comply with the Manual of Style.

NOT RETURNED: 1 Kalbfeld

(Log #3693)

15- 44 - (525-13(a)): Accept in Principle

SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.

RECOMMENDATION: Add the following wording to the end of 525-13(a):

Flexible cords or cables shall be permitted for use as permanent wiring on portable amusement rids and attractions.

SUBSTANTIATION: Article 400-8 prohibits the use of flexible cords or cables as the permanent wiring of a structure. This forces the use of THHN wires run through some wireway for the permanent wiring on portable amusement rides. As these rides move, either during their operation or during their transportation from one location to another, this type (THHN) of wiring is subjected to wear which it wouldn't be subjected to as the wiring of an immovable building or structure. There are situations where, within one circuit, the wiring switches from flexible cable to wires within wireway and back to flexible cable again. By allowing the use of flexible cable, in one continuous run, these splices can be eliminated.

There have been no problems encountered with the use of flexible cords or cables as the permanent wiring on portable rides. Flexible cords or cables have been installed along the steel structural members, as well as within structural members and wireways.

PANEL ACTION: Accept in Principle.

Add the following wording to the end of 525-13(a):

Extra hard usage flexible cords or cables shall be permitted for use as permanent wiring on portable amusement rides and attractions where not subject to physical damage.

PANEL STATEMENT: The use of extra hard usage cord or cable will now be permitted on portable amusment rides and attractions, which was the submitter's intent.

15- 47 - (525-13(f)): Accept in Principle

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.

RECOMMENDATION: Revise to read as follows:

(f) Protection. Flexible cords or cables, where accessible to the public, and where placed on pavement or other hard and smooth surface, are permitted to be covered with matting, provided that the matting does not constitute a greater trip hazard than the uncovered cables.

Flexible cords or cables, where accessible to the public, placed on soft dirt or grass shall be dressed so as to be uncrossed, in a direct line, and slightly separated. Matting shall not be used to cover cables or cords placed in soft dirt or grass.

It shall be permitted to bury cables in a shallow trench. The requirements of Section 300-50 shall not apply.

SUBSTANTIATION: As presently worded this section is often interpreted to mean that cable mats are always to be used to protect the cables. Extra-hard-usage cable is already required and does not require further protection from physical damage. There are no cable mats available which are more sturdy than the extra-hard-usage cable which is currently required.

The mats which are currently available do provide some convenience to the public when correctly used on hard, smooth

surfaces. Especially for wheel chairs and strollers. However, experience shows that they are not the panacea they are perceived to be.

On soft dirt or grass any cables in traffic areas will press down into the dirt if properly dressed. Cable mats do not conform to an uneven surface and increase the very "trip and fall" hazard which they are supposed to alleviate.

If the ground should not be paved, but is too hard for the cables to press down into, it shall be permissible to place the cables in a shallow trench.

PANEL ACTION: Accept in Principle.

Revise to read as follows:

(f) Protection. Flexible cords or cables, where accessible to the public, and where placed on pavement or other hard and smooth surface, shall be permitted to be covered with nonconductive matting, provided that the matting does not constitute a greater trip hazard than the uncovered cables.

Flexible cords or cables, where accessible to the public, placed on soft dirt or grass shall be dressed so as to be uncrossed, in a direct line, and separated by one cable diameter. Matting shall not be used to cover cables or cords placed in soft dirt or grass.

It shall be permitted to bury cables in a shallow trench. The requirements of Section 300-5 shall not apply.

PANEL STATEMENT: The modifications to the submitter's recommendation are for compliance with the Manual of Style and to provide for additional safety.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

NEGATIVE: 2

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

KLEIN: My objection to the Panel Action focuses on the revision which states:

"Flexible cords or cables, where accessible to the public, placed on soft dirt or grass shall be dressed so as to be uncrossed, in a direct line, and separated by one cable diameter. Matting shall not be used to cover cables or cords placed in soft dirt or grass."

I am an avid carnival/festival/fair/Demolition Derby/Circus attendee (particularly food and garlic festivals). For the most part all such events are well attended. Crowds in various degrees of compression are a reality.

I believe this Panel revision will contribute to an increased probability of tripping hazards. Access to parking, concessions, rides and such always use makeshift paths on soft dirt or grass. When attendees arrive early to an event, before crowds can mass, the density of attendees can be around 100 square ft per person - adequate enough space to identify obstacles in ones walking path.

When people gather around a popular booth, exit an entertainment program or leave the event at its closing, the density of attendees can be as little as 4 square ft per person. This density allows for little or no ability to identify obstacles in the "egress" path.

Loose cables or cords on the ground constitute an obstacle.

I trip on cords at events all the time and I am sure others do as well.

The code is charged with the "practical safeguarding of persons...from hazards arising from the use of electricity" (90-1).

TRIPPING IS A HAZARD!

I am also concerned about the permission to bury cables in a shallow trench. (Although I think it is a good idea).

I believe a qualification to ensure the trench surface is flat and compressed is appropriate in areas accessible to the public. I would be even more inclined to require (or at least allow) a nonconductive matting covering to ensure that trench irregularities and loose dirt do not contribute to a tripping hazard.

KRAMER: By not requiring Section 300-5 compliance we are opening a can of worms; how deep is a shallow trench? What happens when the cables pass under an access road, (concessions, rides, and other equipment are moved around the carnival or fairgrounds after the initial cabling is done)? There are no provisions concerning rocks in the backfill over the cables. There is also nothing about using cables suitable for direct burial.

This is a portable installation; how will the cables be removed? Will they be dug up by someone with a pick ax and shovel or will someone stand at the end of the cable and pull it out of the ground? Both of these ways could damage the insulation. A few days later these possibly damaged cables may be used where accessible to the public and, where placed on pavement or other hard and smooth surfaces, may not be covered with a nonconductive mat, presenting a possible shock hazard.

Thus, in order to alleviate a possible tripping hazard, we have increased the hazards of potential electrocution.

(Log #3695)

15- 48 - (525-13(g)): Accept

SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.

RECOMMENDATION: Delete the two usages of the word, "temporary."

SUBSTANTIATION: This section, 525, applies to portable, not temporary wiring. The word, "temporary", as used here are not necessary anyway.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

NOT RETURNED: 1 Kalbfeld

(Log #934)

15- 49 - (525-15(b), (c)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(b) Busbars and Terminals. Busbars shall have an ampere rating not less than the ~~overcurrent device~~ ampacity of the feeder supplying the box. Where the conductors terminate directly on busbars, busbar connectors shall be provided.

(c) Receptacles and Overcurrent Protection. Receptacles shall have overcurrent protection installed within the box. The overcurrent protection shall not exceed the ampere rating of the receptacle except as permitted in Section 210-21(b)(3). ~~Article 430 for motors.~~

SUBSTANTIATION: If the portable distribution box supplies a motor(s), the feeder overcurrent device could exceed the ampacity of the feeder, per Article 430. Since the busbars are an extension of the feeder, it need only have an ampacity not less than the feeder. Where there is a main overcurrent device in the box busbar rating not less than the main rating should be sufficient. Present wording could require 70 ampere rated busbars if a 70 ampere rated feeder supplying the box terminates at a 50 ampere rated main overcurrent device in the box with 50 ampere rated busbars.

Present text of (c) does not allow for a duplex 15 ampere rated receptacle supplied by a 20 ampere overcurrent device. Article 430 doesn't have a provision for overcurrent protection to exceed a receptacle rating.

PANEL ACTION: Reject.

PANEL STATEMENT: The present wording provides the correct protection required for a safe installation. The size of the feeder conductors may be oversized for other reasons, such as voltage drop.

(Log #CP1502)

15- 50a - (525-18): Accept

Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.

SUBMITTER: CMP 15

RECOMMENDATION: Revise existing Section 525-18 to read as follows:

525-18. Ground-Fault Circuit-Interrupter Protection.

(a) Receptacles Requiring GFCI Protection.

(1) General-Use 15- and 20-Ampere, 125-Volt Receptacles. All 125-volt, single-phase, 15- and 20-ampere, NEMA configuration 5-15 and 5-20 receptacles shall have listed ground-fault circuit-interrupter (GFCI) protection. Only those receptacles used during disassembly and reassembly or readily accessible to the general public shall be required to comply.

(2) Other applicable sections. Receptacles which require GFCI protection under other sections, including, but not limited to:

a. 551-40(c)

b. 551-41(c)

c. 680-6

d. 680-41(a)

e. 680-42
f. 680-51(a)
g. 680-56(a)
h. 680-57(b)

(b) Where GFCI protection is not required.

(1) Egress Lighting. Egress lighting shall not be connected to the load side terminals of a ground-fault circuit-interrupter receptacle. Branch circuits which supply egress lighting shall not be protected by a GFCI circuit breaker.

(2) Other Receptacles. Receptacles other than NEMA 5-15 or 5-20 which only facilitate quick and safe disconnecting and reconnecting of electrical equipment shall not be required to have GFCI protection. These receptacle outlets shall be permitted to have GFCI protection.

SUBSTANTIATION: The wording of Section 525-18, in the 1999 NEC, which describes which receptacles are to be protected, is so vague that all receptacles at a carnival, circus, or fair are required to have GFCI protection. However, it is not necessary to have every receptacle outlet GFCI protected to ensure electrical safety at these locations.

Other articles already require sufficient GFCI protection. GFCI protection which is specified in these other articles is important enough to warrant listing those articles herein.

Carnivals, circuses, and fairs have a lot of receptacles to facilitate quick and safe disconnecting and reconnecting of electrical equipment. One large modern ride typically contains 100 receptacles. Some use as many as 300.

Recreational vehicles are used extensively as living quarters. Current requirements for RV's, Section 551-41(c), including GFCI protection for the outlets in the bathroom and outside. Section 525-18 now requires that all outlets in RV's at these locations be GFCI protected. This also applies to all other trailers in use such as office trailers, shop trailer, etc. Requiring that only NEMA configuration 5-15 and 5-20 receptacles require GFCI protection, and by requiring other receptacles, which only facilitate the quick and safe disconnecting and reconnecting of electrical equipment, to be of a different configuration will provide protection for persons utilizing hand held tools, appliances, or luminaires.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 19

NOT RETURNED: 1 Kalbfeld

(Log #3696)

15- 50 - (525-18): Accept in Principle in Part

SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.

RECOMMENDATION: Replace existing Section 525-18 with the following:

525-18. Ground-Fault Circuit-Interrupter Protection.

(a) Receptacle outlets requiring GFCI protection.

(1) General-Use 15- and 20-Ampere, 125-volt receptacles. All 125-volt, single-phase, 15- and 20-ampere, NEMA configuration 5-15 and 5-20 receptacle outlets shall have listed ground-fault circuit-interrupter (GFCI) protection.

(2) Receptacles which require GFCI protection under other sections, including, but not limited to, Sections: 551-40(c); 551-41(c); 680-6; 680-51(a); and 680-56(c).

(4) Listed Cord Sets. For the purposes of this section, listed cord sets incorporating GFCI protection for personnel shall be permitted. the GFCI shall be permitted to be an integral part of the attachment plug or located in the power-supply cord, within 12 in. (305 mm) of the attachment plug.

(b) Where GFCI protection is not required.

(1) Appliance Receptacles. Receptacles supplying items, such as cooking and refrigeration equipment, which are incompatible with ground-fault circuit-interrupter devices shall not be required to have ground-fault circuit-interrupter protection.

(2) Egress Lighting. Egress lighting shall not be connected to the load side terminals of a ground-fault circuit-interrupter receptacle. Branch circuits which supply egress lighting shall not be protected by a GFCI circuit breaker.

(3) Other Receptacles. Receptacle outlets other than NEMA 5-15 or 5-20 which only facilitate quick and safe disconnecting and reconnecting of electrical equipment shall not be required to have GFCI protection. These receptacle outlets shall be permitted to have GFCI protection.

525-19. Grounding conductor continuity assurance. The effectiveness of the grounding conductor(s) to reduce electrical shock hazards as required by Sections 210-7(c); 250-114; 250-138; and 305-4(d) shall be determined each time that portable electrical equipment is reconnected as follows:

All conductive surfaces which people are able to contact shall be tested by the application of a "Tic Tracer". Any indication of voltage present shall be investigated to determine the cause. And, the continuity of the grounding conductor(s) which should be effectively grounding that surface shall be restored.

Examples of places to test: frames of rides, trailers, light fixtures which are within reach, appliances, electrically powered games, counters of ticket booths and concession trailers, coin slots of coin operated amusements, and, metal frames of flea-market booths which contain electrical equipment.

SUBSTANTIATION: The wording of Section 525-18, in the 1999 NEC, which describes which receptacles are to be protected, is so vague that all receptacles at a carnival, circus, or fair are required to have GFCI protection. However, it is not necessary to have every receptacle outlet GFCI protected to ensure electrical safety at these locations.

Other articles already require sufficient GFCI protection. GFCI protection which is specified in these other articles is important enough to warrant listing those articles herein.

Carnivals, circuses, and fairs have a lot of receptacles to facilitate quick and safe disconnecting and reconnecting of electrical equipment. One large modern ride typically contains 100 receptacles. Some use as many as 300.

Recreational vehicles are used extensively as living quarters. Current requirements for RV's, Section 551-41(c), including GFCI protection for the outlets in the bathroom and outside. Section 525-18 now requires that all outlets in RV's at these locations be GFCI protected. This also applies to all other trailers in use such as office trailers, shop trailer, etc.

Requiring that only NEMA configuration 5-15 and 5-20 receptacles require GFCI protection, and by requiring other receptacles, which only facilitate the quick and safe disconnecting and reconnecting of electrical equipment, to be of a different configuration will provide protection for persons utilizing hand held tools, appliances, or light fixtures.

The grounding conductor assurance should be considered in it's own section, 525-19. This new procedure will contribute more to electrical safety at a carnival, circus, or faire than GFCI protection, and should be done whether GFCI protection is provided or not.

We have used the "Tic Tracer", procedure for the last 10 years, effectively reducing the number of alleged electrical socks from approximately one-per-weeks to about two per season. Additionally, all of our electricians carry a "Tic tracer" with them to continuously monitor the effectiveness of the grounding conductor.

It will be more effective in providing electrical safety at a carnival, circus, or fair if authorities having jurisdiction use the "Tic tracer" method of determining the effectiveness of the grounding conductor(s) rather than merely enforcing that a procedure has been documented.

PANEL ACTION: Accept in Principle in Part.

PANEL STATEMENT: Refer to panel action and statement on Proposals 15-50a and 15-50b.

The term "Tic Tracer" is not code appropriate term.

(Log #336)

15- 52 - (525-18(b)): Reject
SUBMITTER: Mike Theisen, St. Cloud, MN
RECOMMENDATION: Delete this section.
SUBSTANTIATION: My experience from inspecting carnivals and the like leads me to believe that any appliance which cannot operate on a GFCI protected outlet represents the very hazard which we are trying to eliminate by requiring GFCI protection. All appliances must be subject to the requirement for GFCI protection, and those that are not in good enough repair to operate on a GFCI protected outlet should be repaired or replaced.
PANEL ACTION: Reject.
PANEL STATEMENT: Not all appliances should be protected. Refer to panel action and statement on Proposal 15-50a. All 15- and 20-ampere appliance receptacles are required to have GFCI protection.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:
KLEIN: All 15 and 20 ampere appliance receptacles should be required to be GFCI protected.
Panel response to 15-50a only requires those receptacles used during disassembly and reassembly, or readily accessible to the public to have GFCI protection. Most appliances at the concerned venues are readily accessible, but their receptacles are not.
In the comfort, familiarity and pace of life in our own homes, we are required to be GFCI protected from all our portable appliances. It is not unreasonable to impose the same safety requirements (if not exceed it) when we approach a temporary booth, set up with portable appliances for our hot dogs, popcorn or cotton candy.

(Log #CP1503)

15- 50b - (525-19 (New)): Accept
Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
SUBMITTER: CMP 15
RECOMMENDATION: Add new Section 525-19 as follows:
525-19. Grounding conductor continuity assurance.
The effectiveness of the grounding conductor(s) to reduce electrical shock hazards as required by Sections 210-7(c), 250-114, 250-138, and 305-4(d) shall be tested each time that portable electrical equipment is reconnected.
SUBSTANTIATION: The grounding conductor assurance should be considered in its own section, 525-19. This new requirement will contribute more to electrical safety at a carnival, circus, or fair than GFCI protection alone, and should be done whether GFCI protection is provided or not.
PANEL ACTION: Accept.

COMMENT ON AFFIRMATIVE:
JOHNSON: This is an excellent requirement, but a program such as in Section 305-6(b)2 should be included to assure that the test is done and recorded by qualified personnel each time the equipment is set up.
KRAMER: In order to help the users of this article, maintain an environment essentially safe and free from the hazards of electricity, we should offer some guidance as to the testing we are requiring in the new 525-19.
What we are doing here is requiring an assured equipment grounding conductor program. The code has already provided such a program. This existing program is better than 10 years old. By incorporating Article 305-6(b)(2), we offer this guidance and also include the record keeping requirement of having the results available for the authority having jurisdiction.
It has been said that a version of this testing is currently being performed at fairs and carnivals. This would formally incorporate it, and by having specific requirements, increase the level of safety at such venues, possibly eliminating the deadly accident discussed in Proposal 15-56 (Log #2793).

(Log #3746)

15- 53 - (525-21(3)): Accept in Part
SUBMITTER: John H. Schwab, Jr., City of Wauwatosa, WI
RECOMMENDATION: Revise as follows:
Metal frames and metal parts of rides, concessions, <u>tents,</u> trailers, trucks, or other equipment that contain or support electrical equipment <u>or raceways (nonmetallic).</u>
SUBSTANTIATION: Some carnival people say a metal tent used for something other than concessions does not have to be bonded. Also, if nonmetallic raceways are supported by metal pipe, they should be not only bonded but grounded.
PANEL ACTION: Accept in Part.
Revise as follows:
Metal frames and metal parts of rides, concessions, <u>tents,</u> trailers, trucks, or other equipment that contain or support electrical equipment
PANEL STATEMENT: The term "or raceways (nonmetallic)" is rejected because it is redundant to the balance of the requirement.

(Log #2793)

15- 56 - (525-23): Reject
SUBMITTER: Linda S. Aguiar, S. Dartmouth, MA
RECOMMENDATION: Reconsider A98 ROP 15-74 and accept.
SUBSTANTIATION: I have provided an article from the IAEI News Jan/Feb edition (page 46). This article describes the exact scenario depicted in Proposal 15-74 and Mr. Edwin S. Krammer's comments in A98 ROC 15-58. This 21-year old women would not have died if there had been a supplemental ground as proposed. Now you have a reported fatality to substantiate this requirement. Gentlemen, this code is about safety and "contains provisions that are considered necessary for safety."

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's substantiation does not provide adequate technical justification that the recommended change would resolve the concern. In the example cited, the unit may not have been properly grounded. A grounding electrode at this truck might not have prevented the tragic occurrence since there was no equipment grounding conductor. The submitter's concerns have been addressed to some extent in 15-50b.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:

JOHNSON: The hazard of ungrounded structures needs to be analyzed very carefully. If the equipment ground becomes interrupted, the frame of an ungrounded structure can accidentally be raised to ine to ground potential. The equipment ground is a very important and effective system, however, it unfortunately is not fail safe. It can be open without an indication. The new Section 225-19 approved by Proposal 15-50b is an excellet step, but it has no provision to assure that the testing is done each time the equipment is set up. GFCI is only effective on equipment connected to protected receptacles. Perhaps a redundant equipment ground system could be used in place of grounding the structure. Somehow, there should be "double" assurance that protection is in effect.

(Log #3697)

15- 57 - (525-23 (New)): Reject
SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Add a new Section 525-23 to read as follows:

525-23. Grounding Electrode. It shall not be necessary to provide grounding electrode(s) for generators used under this article.

Article 250-34 shall not apply to carnival generators.
SUBSTANTIATION: See related proposal to revise Section 250-34.

The requirements of Section 250-2 can be met without grounding electrodes and grounding-electrode conductors. Especially with the 1999 NEC requirement of, "Section 525-18. Ground-Fault Circuit-Interrupter Protection for Personnel."

A lot of authorities having jurisdiction's time and effort is wasted in enforcing the use of grounding electrodes and grounding-electrode conductors. This is followed by a lot of expense and effort on the part of carnivals.

The use of grounding electrodes and grounding-electrode conductors does not improve the safety of a carnival electrical system.
PANEL ACTION: Reject.
PANEL STATEMENT: The purpose of the a grounding electrode is the primary reference point in creating a grounded system. The requirements for grounding of generators are addressed in 250-30 and 250-34. System grounding requirements are addressed in 250-20.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 20
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:

DUNN: The concept of running carnival generators without connecting the generator frame to a grounding electrode is difficult to accept at first. I remember well my first experience where disconnecting the grounding electrode was safer.

I started working as a carnival electrician during my summer vacations from college. During the summer of 1964, we were playing a beautiful grassy, treed, park in Northern Indiana. The first evening we were there it started raining shortly after dark. I was in the generator trailer, to avoid the rain, when I noticed that the ammeters were reading higher than they had been reading before the rain started. This seemed unlikely because the rides had stopped running during the rain.

At this time, somebody called me out of the generator saying, "You better get over to the pony ride fast! The ponies are being shocked! and, nobody can touch the ride to get them off."

I immediately went to the "junction box", where the lights for the pony ride were connected, and disconnected the wires. There was no improvement in the situation at the pony ride. The ponies and people were still being shocked.

While I was pondering over what to do next, I was approached by an old man, Bill, who also worked on the show. He said, "Sonny, I used to be the electrician on this show before I got too old to do the job. If you intend to save those ponies, you better go to the generator and cut the wire going to the ground rod."

My reaction was that he was certainly too old to do the job if that was his solution to this problem. However, with the lights disconnected, I couldn't see how the pony ride was being energized. And, it was necessary to do something fast. Other people were also urging me to follow Bill's advice.

So, I went to the generator trailer, and I cut the wire to the ground wire. It was dark behind the trailer, and I noticed a substantial arc as I severed the wire.

When I returned to the pony ride we were able to touch the ride and get the ponies away. While we were doing this I noticed that the ponies still seemed to be receiving a slight shock when they moved past one side of the circle. This of course, was at the windward side where the ground was wet from the rain. This was also the side nearest to the electric distribution wires and box. Which were also exposed to the rain.

After considerable study over the next several weeks, it was discovered that the process which was used to install the solder-on lugs to the ends of the wires had caused the insulation to become conductive for about 15 in. from each end. This caused current to flow from the defective cables - through the water at the surface - through the ponies, their ride, and the steel stakes which held the ride to the ground, to earth - through the earth to the grounding electrode - through the "grounding electrode conductor" to the neutral of the generator. Disconnecting the "grounding electrode conductor" opened this path and consequently relieved the ponies and people from electric shocks.

This is one example of why it is not only unnecessary but, even undesirable to connect carnival generators to a "grounding electrode".

I can understand the Panel's first reaction to such a rash sounding proposal. Most of them have probably never even considered it. However, I have convinced many well educated and experienced electricians, electrical engineers, inspectors, and technicians that grounding electrodes are not necessary on carnival generators. None of these people were easy to convince either.

(Log #3387)

15- 58 - (525-25(e) (New)): Accept in Principle
SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Add paragraph (e) to read as follows:

(e) Flexible Cords or Cables. Where flexible cords or cables are used and are not subject to physical damage, they shall be permitted to be listed for hard usage. When used outdoors, flexible cords and cables shall also be listed for wet locations and shall be sunlight resistant.
SUBSTANTIATION: Where flexible cords or cables are used as part of the wiring within a ride, concession, or attraction, hard-usage listing is sufficient.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to the panel action and statement on Proposal 15-43. The correct reference to the current code is 525-13(a) rather than 525-25(e).

(Log #4246)

15- 60 - (525-40): Reject

Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

"Wiring and Equipment for Contained Volumes of Water. Electrical installations for or adjacent to attractions using contained volumes of water shall comply with the provisions of Section 680-6."

SUBSTANTIATION: This proposal is the submitter's best guess as to the Article 680 requirements CMP 15 might have intended when this section went into the 1999 NEC. The reference to anything "applicable" in Article 680 is impermissibly vague. Does CMP 15 actually intend compliance with the 3-ft parameter in 680-7? Bonding rules in 680-22 for equipment that is repeatedly assembled and disassembled? Even storable pools don't require that. How about only cord- and plug-connected lighting assemblies; must they be used per 680-32? Enhanced panelboard grounding rules in 680-25(d)? All of these rules could arguably be applicable, or none of them. CMP 15 should revisit this issue and clarify just what it had in mind.

PANEL ACTION: Reject.

PANEL STATEMENT: The reference should not be restricted to just one section. The panel's intent for this section is for the applicable portions of Article 680 to be applied; i.e., grounding, bonding, distance from power lines. Refer also to Proposal 15-50a.

ARTICLE 527 — TEMPORARY INSTALLATIONS

(Log #1485)

3- 141 - (527 (New)): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Revise the title of Article 527 (formerly Article 305) as follows:

Temporary ~~Wiring~~ Installations

Revise the scope of the article as follows:

527-1 ~~305-1.~~ Scope. The provisions of this article apply to temporary electrical power and lighting installations.

SUBSTANTIATION: It is recognized in this proposal that the TCC has relocated Article 305 to Article 527. As such, the modifications shown to the scope reflect that relocation.

The existing title of the article does not accurately reflect the contents of the article. There are many more requirements covered than simply the wiring methods and in fact, actual requirements for wiring methods are only briefly covered in 305-4(a), (b), and (c). There are installation requirements for receptacles, disconnecting means, lamp protection and GFCI protection for personnel. These are obviously more than simply wiring methods.

With the transfer of Article 305 out of Chapter 3, in the scope the modifying clause, "wiring methods that may be of a class less than would be required for a permanent installation," is not needed. Section 90-3 notes that requirements in Chapter 3 apply unless amended by Chapter 5.

PANEL ACTION: Accept.

PANEL STATEMENT: The panel understands the decision of the TCC in relocating Article 305 to new Article 527. The panel also understands that the responsibility of Article 527 will remain with CMP 3. In addition, the panel recognizes that scope statements as covered in Section 2.2.1 of the Style Manual are the responsibility of the TCC.

(Log #1887)

15- 63 - (530-1, FPN (New)): Reject
SUBMITTER: Richard D. Thompson, Thompson Assoc.
RECOMMENDATION: Add the following fine print note:
FPN: Additional requirements for minimum set lighting power and installation of portable power cables is to be found in NFPA 140, "Standard for Motion Picture and Television Production Soundstages and Approved Production Facilities."
SUBSTANTIATION: This new NFPA Standard 140 was adopted at the May 1999 annual meeting. In this standard Article 3-5 Electrical Requirements incorporates the requirements of a minimum lighting load of 35 watts per square foot (377 w/m^2) for production lighting and power. Further, this standard prohibits the auxiliary power cables from portable generators from being run through fire rated windows and doors.
By referencing this new Fire Safety Standard, the provisions of this standard will be brought to the attention of the authority having jurisdiction, users and designers of sound stages and approved production facilities.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is using the FPN as a requirement, not as explanatory. NFPA 140 may not be adopted by all jurisdictions, and is therefore not enforceable.

(Log #1889)

15- 64 - (530-2-Approved Production Facilities): Reject
SUBMITTER: Richard D. Thompson, Thompson Assoc.
RECOMMENDATION: Add the following definition:
Approved Production Facilities. A building or group of buildings where the occupancy has been changed to motion picture or television studio or soundstage, and meets the requirements of NFPA 140, "Motion Picture and Television Production Studio Soundstages and Approved Production Facilities."
SUBSTANTIATION: The addition of this definition, will provide the authority having jurisdiction with the language necessary to enforce the provisions of both NEC Article 530 as well as NFPA 140. Presently, Article 530's definitions refer to the traditional "Hollywood" motion picture studio and soundstage. Many film and television productions are produced in converted industrial buildings, (A.K.A. "warehouse studios"), aircraft hangers, former office buildings, former hospitals, and any other large open clear span structure. The intent of NFPA 140 is to apply a minimum fire safety code standard to all facilities used for motion picture and television production where the certificate of occupancy has been changed to this use.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "approved production facilities" is not used in the code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kalbfeld

(Log #1888)

15- 65 - (530-10): Reject
SUBMITTER: Richard D. Thompson, Thompson Assoc.
RECOMMENDATION: Add the following text to this sub-section:
Motion picture and television production soundstages and approved production facilities shall be provided with a minimum of 35 W/ft^2 (877 W/m^2) dedicated for production lighting and power.
SUBSTANTIATION: This statement is a repeat of the statement found in NFPA 140, "Standard for Motion Picture and Television Production Soundstages and Approved Production Facilities." Section 3-5, Electrical Requirements, which was adopted by the NFPA at their May 1999 annual meeting.
The NFPA Technical Committee that developed NFPA 140 consisted of representatives of the major film and television studios, fire departments, insurance underwriters, and knowledgeable industry personnel. In their deliberations, it was strongly urged to add to this fire code standard a minimum requirement for the electrical power used for set lighting. Typically, lighting fixtures in the 1000, 2000, 5000 and 10,000 watt sized are used in lighting motion picture and television productions. The committee found that many productions were and continue to be filmed in industrial buildings where the installed electrical service is woefully inadequate. Typically, portable generators are needed to augment the existing electrical service. This requirement in NFPA 140 does not preclude the use of portable generators, should the needs of the production exceed this minimum requirement.
It is the intent of this proposal to the 2002 NEC to incorporate this provision from NFPA 140 into the Electrical Code so as to facilitate the knowledge and information of this new requirement such that the AHJ, electrical engineers, building owners and studio operators can comply with this standard.
PANEL ACTION: Reject.
PANEL STATEMENT: The provisions of 35 W/ft^2 applies to the electrical service provision of a production facility and does not pertain to the unique installation requirements for motion picture and television studios. The production lighting loads calculation parameters are more appropriately placed in Article 220.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

15- 66 - (530-11): Accept
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.
SUBMITTER: George W. Flach, Nat'l Armored Cable Mfrs' Assn.
RECOMMENDATION: Revise text to read as follows:
530-11. Permanent Wiring. The permanent wiring shall be Type MC cables, Type AC cable containing an insulated equipment grounding conductor sized in accordance with Table 250-122, Type MI cable, or in approved raceways.
SUBSTANTIATION: Type AC cable with an insulated equipment ground is equivalent to Type MC cable and should be included as a permitted wiring method.

PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 17
NEGATIVE: 1
NOT RETURNED: 1 Kalbfeld
EXPLANATION OF NEGATIVE:
HIRSCHLER: There has been no substantiation introduced to show that AC cable exhibits the physical integrity that this panel has always required for wiring methods used in theaters. Moreover, AC cable has not been shown to have the same fire safety characteristics of MI cable, or MC cable, because of the insulated conductor, which do not have to meet sufficient fire safety requirements.

(Log #3029)

15- 67 - (530-12(b)): Reject
SUBMITTER: Richard D. Thompson, Thompson Assoc.
RECOMMENDATION: Revise text as follows:
530-12(b) Special Effects and Electrical Equipment Used as Stage Properties. The wiring for stage effects and electrical equipment used as stage properties shall be permitted to be wired with single-conductor or multi-conductor listed flexible cords or cables. ~~if~~ And, the conductors are protected from physical damage and secured to the scenery by approved cable ties or by insulated staples. Splices or taps shall be permitted where such are made with polarized and listed devices. ~~and the circuit is protected at not more than 20 amperes.~~ Circuits shall have overcurrent protection based on the conductor size ampacity rating in Table 400-5(a), and shall have a maximum length calculated to prevent a voltage drop exceeding 5 percent at full load and nominal applied voltage.
SUBSTANTIATION: This section was adopted new in the 1999 NEC. Since then, there have been misinterpretations and assumptions made that SPT-2 cord (aka "Zip Cord") is or is not permitted as a primary electrical distribution method on scenery. Most often this type wiring is for use on single small wattage lamps, typically 6 watt S-6 lamps used for signaling. One example we have seen is an elevator cab with the floor annunciator panel wired with individual lamp circuits using the 6 watt lamps and each circuit wired with SPT-2 cord terminating in back of the set to a switch box such that one or more lamps can be illuminated thereby showing the floors selected by the actors in the scene being filmed. This cable type is also used for low voltage applications.
The concern of the authorities having jurisdiction has been that often industry practice has been found where this type cable is used without proper overcurrent protection, polarization, or any limit to the length of the cable run.
This article as presently written, limits the maximum overcurrent protection to 20 amps. However, 18 gauge SPT-2 cord, which is the most commonly used in these applications, has a maximum ampacity rating of 10 amps. Using this wiring method also does not incorporate any grounding method and can only rely on polarization of the circuit to provide a level of safety. Wiring devices of the insulation piercing type, while listed, are not necessarily specified by the user with polarized male and female plugs and connectors. The primary manufacturer of this product (Eagle Electric) now offers these devices as listed and polarized in a NEMA 1-15 configuration.
Using the Fine Print Note No. 4 of Article 210-19, where the maximum voltage drop is limited to 5 percent. Calculations based on a #18 gauge wire having a circular mil area of 1620 with an applied voltage of 120 volts, and not exceeding the 5 percent voltage drop results in a maximum length is 45 ft (13.72 m). By incorporating a voltage drop limitation we can effectively control the length of a cable run.
The intent of this change is to limit the length and ampacity of SPT-2 cord to that shown in Table 400-4(a), meet the 5 percent voltage drop requirement, and that when splices or taps are used, the polarization of the circuit must be maintained.
PANEL ACTION: Reject.
PANEL STATEMENT: At present, SPT-2 is not accepted by the testing agencies. The reference should be to SPT-3. The new text proposed allows lower standards of wiring methods than already accepted. Overcurrent protection of flexible cords and cables is already covered in 240-4. Polarization requirements for lampholders is already covered in 410-47.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kalbfeld

(Log #935)

15- 68 - (530-18(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Feeders. In buildings used primarily for motion picture production, the feeders from the substations to the stages shall be protected by overcurrent devices (generally located in the substation) having suitable ampere ratings. The overcurrent devices shall be permitted to be multipole, or single-pole ~~gang operated~~ if provided with means for simultaneous disconnection from the supply source. ~~No pole or overcurrent device shall be required in the neutral conductor.~~ The overcurrent device setting for each feeder shall not exceed 400 percent of the ampacity of the feeder, as given in applicable tables of Article 310.
SUBSTANTIATION: Editorial. The first paragraph indicates devices are circuit breakers or fuses. The term "gang-operated" is not clear; as applied to single pole circuit breakers does it mean a handle tie? A single pole trip device does not necessarily gang operate other circuit breakers where a handle tie is used. The term is even more obscure as applied to fuses which are not normally gang operated, though a switch or contactor to disconnect them may be. This section infers a single pole device in the neutral is permissible. An open neutral can cause a hazard. The condition of an overcurrent device in the neutral (grounded) conductor is covered elsewhere in the code, for example Section 240-22(a) and Chapter 5 is seen to modify those requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposed text does not relate to the substantiation. The existing text properly states the intent. The proposed arrangement of the wording does not accomodate single pole gang operated switches which open the neutral with the phase conductors.

15- 69 - (530-18(e)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 8" to "8 AWG".
SUBSTANTIATION: To provide consistency throughout the Code The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kalbfeld

(Log #3428)

15- 70 - (530-52): Accept
SUBMITTER: Kenneth E. Vannice, NSI Corp./Rep. US Inst. for Theatre Tech. Engr. Comm.
RECOMMENDATION: Revise text to read as follows:
"~~Motors and Other~~ Electrical Equipment in Cellulose Nitrate Film Storage Vaults. Except as permitted in Section 530-51, no receptacles, outlets, ~~electrical motors,~~ heaters, portable lights, or other portable electrical equipment shall be located in cellulose nitrate film storage vaults. Electric motors shall be permitted provided they are listed for the application and comply with Article 500, Class I, Division 2."
SUBSTANTIATION: The current edition of NFPA 40, "Storage and Handling of Cellulose Nitrate Motion Picture Film" was revised during the 1997 Code cycle. Section 2-7.4 was added stating: "Extended term storage vaults shall be permitted to have refrigeration or air conditioning systems installed where necessary to provide temperature and humidity control." This provision was added to NFPA 40 to answer the concerns of the Nation's film archivists in their effort to preserve our motion picture film history and heritage. Investigations undertaken by the manufacturers of nitrate film, and various motion picture film repositories found that storage of nitrate film at temperatures between 72°F and 32°F (22.2°C and 0°C) was the best way to preserve the material and

image. Additionally, storage at these temperatures considerably reduces the decomposition of the nitrate film and the possibility of self-ignition.

In order to incorporate appropriately design and listed explosionproof air handlers in both new and existing nitrate motion picture film vaults, a fan motor is necessary. Under strict interpretation of the existing Section 530-52, no motors of any kind are permitted in cellulose nitrate film vaults. Therefore, acceptances of this proposal would permit the installation of small explosion proof motors that meet the requirements of NEC Article 500, Class 1, Division 2, and as specified for the electrical equipment in NFPA 40, Section 2-6.

Further, it should be pointed out to the CMP that the assumed transfer of nitrate motion picture film to a safety stock will not occur. There exists no methods that insure the complete transfer of all information, (i.e., image) from the original nitrate negative or print to any other media. Nitrate motion picture film vaults continue to exist, and be retrofitted for refrigeration. New film vaults will be constructed as private collections of nitrate motion picture films are being discovered and become part of our visual heritage.

PANEL ACTION: Accept.

(Log #CP1507)

15- 70a - (530-64): Accept
SUBMITTER: CMP 15
RECOMMENDATION: Revise 530-64 to read as follows:

530-64. Direct-Current Switchboards.

(a) General. Switchboards not exceeding 250 volts dc between conductors, where located in substations or switchboard rooms accessible to qualified persons only, shall not be required to be dead-front.

(b) Circuit Breaker Frames. Frames of dc circuit breakers installed on switchboards shall not be required to be grounded.

SUBSTANTIATION: The revisions have been made to comply with NFPA National Electrical Code Style Manual.
PANEL ACTION: Accept.

15- 71 - (530 Part G): Accept in Principle in Part

NOTE: The following proposal consists of Comment 15-74 on Proposal 15-94 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 15-94 was:

Revise as follows:

ARTICLE 530 -- MOTION PICTURE AND TELEVISION STUDIOS AND SIMILAR LOCATIONS

~~G. Separately Derived systems with 60 Volts to Ground~~

ARTICLE 647 -- SENSITIVE ELECTRONIC EQUIPMENT

647-1. Scope. The provisions of this article shall apply to all occupancies where the use of sensitive electronic equipment is connected to a separately derived system operating at 120 volts line-to-line and 60 volts to ground.

~~530-70.~~ 647-2. General. Use of a separately derived 120-volt single-phase 3-wire system with 60 volts on each of two ungrounded conductors to a grounded neutral conductor shall be permitted for the purpose of reducing objectionable noise in ~~audio/video production or other similar~~ sensitive electronic equipment locations provided that its use is restricted to electronic ~~equipment only and that~~ all of the requirements in Sections 647-3 through 647-7 are met.

~~530-71.~~ 647-3. Wiring Methods.

(a) Panelboards and Overcurrent Protection. Use of standard single-phase panelboards and distribution equipment with a higher voltage rating shall be permitted. The system shall be clearly marked on the face of the panel or on the inside of the panel doors. Common-trip two-pole circuit breakers that are identified for operation at the system voltage shall be provided for both ungrounded conductors in all feeders and branch circuits.

(b) Junction Boxes. All junction box covers shall be clearly marked to indicate the distribution panel and the system voltage.

(c) Color Coding. All feeders and branch-circuit conductors installed under this section shall be identified as to system at all splices and terminations by color, marking, tagging or equally effective means. The means of identification shall be posted at each branch-circuit panelboard and at the disconnecting means for the building.

(d) Voltage Drop. The voltage drop on any branch circuit shall not exceed 1.5 percent. The combined voltage drop of feeder and branch circuit conductors shall not exceed 2.5 percent.

647-4. 3-phase Systems. Where 3-phase power is supplied, a separately derived 6-phase "Wye" system with 60 volts to ground installed under this article shall be configured as three separately derived 120-volt single-phase systems having a combined total of no more than three main disconnects.

~~530-72.~~ 647-5. Grounding.

(a) General. The system shall be grounded as provided in Section 250-26 as a separately derived single-phase 3-wire system.

(b) Grounding Conductors Required. Permanently wired utilization equipment and receptacles shall be grounded by means of an equipment grounding conductor run with the circuit conductors to an equipment grounding bus prominently marked "Technical Equipment Ground" in the originating branch-circuit panelboard. The grounding bus shall be connected to the grounded conductor on the line side of the separately derived system's disconnecting means. The grounding conductor shall not be smaller than that specified in Table 250-95 and run with the feeder conductors. The technical equipment grounding bus need not be bonded to the panelboard enclosure.

Exception: Other grounding methods authorized elsewhere in this Code shall be permitted where the impedance of the grounding return path does not exceed the impedance of equipment grounding conductors sized and installed in accordance with ~~Part C of~~ this article.

(FPN No. 1): See Section 250-95 for equipment grounding conductor sizing requirements where circuit conductors are adjusted in size to compensate for voltage drop.

(FPN No. 2): These requirements limit the impedance of the ground fault path where only 60 volts applies to a fault condition instead of the usual 120 volts.

~~530-73.~~ 647-6. Receptacles.

(a) General. Where receptacles are used as a means of connecting equipment, the following conditions shall be met:

(1) All 15 and 20 Amp. receptacles shall be GFCI protected.

(2) All outlet strips, adapters, receptacle covers and faceplates shall be marked as follows:

WARNING - TECHNICAL POWER
Do not connect to lighting equipment.
For electronic equipment use only.
60/120 V.1~~-o-~~AC
GFCI protected

(3) A 125-volt, single-phase, 15- or 20-ampere rated receptacle outlet having on of its current carrying poles connected to a grounded circuit conductor shall be located within ~~6 ft. (1.83 m)~~ 2 ft. (.61 m) of all permanently installed 15- or 20-ampere rated 60/120-volt technical power-system receptacles.

(4) All 125-volt receptacles used for 60/120-volt technical power shall have a unique configuration and be identified for use with this class of system.

Exception: 125-Volt, single phase, 15- or 20-ampere rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted on portable distribution equipment, and in machine rooms, control rooms, equipment rooms, equipment racks and other similar locations that are restricted to use by qualified personnel.

(b) Isolated ground receptacles Isolated ground receptacles shall be permitted as described in Section 250-74 Exception No. 4. However, the branch circuit equipment grounding conductor shall be terminated as required in Section ~~530-72(b)~~ 647-5(b).

647-7. Lighting Equipment. Lighting equipment installed under this article shall meet the following conditions (a-c):

(a) Disconnecting Means. All lighting equipment shall have a disconnecting means that simultaneously opens all ungrounded conductors, and shall be located within sight or be capable of being locked in the open position.

(b) Fixtures. All lighting fixtures shall be permanently installed.

Exception: Portable lighting equipment shall be permitted on sound stages and in theaters provided that the equipment is restricted to use by qualified personnel.

(c) Exposed Screw-shell. Lighting fixture installed under this section shall not have an exposed lamp screw-shell.

SUBMITTER: Martin Glasband, Equi-Tech Corp.

RECOMMENDATION: Proposal should have been accepted in principle and/or in part. The committee's concerns regarding the safety issues that were not included in the original proposal should have been considered and incorporated into a revised version of the proposed text.

~~ARTICLE 530 MOTION PICTURE AND TELEVISION STUDIOS AND SIMILAR LOCATIONS~~

~~C. Separately Derived Systems with 60 Volts to Ground~~

ARTICLE 647 - SENSITIVE ELECTRONIC EQUIPMENT

647-1. Scope. The provisions of this article shall apply to commercial and industrial occupancies where the use of sensitive electronic equipment is connected to a separately derived system operating at 120 volts line-to-line and 60 volts to ground.

~~530-70.~~ 647-2. General. Use of a separately derived 120-volt single-phase 3-wire system with 60 volts on each of two ungrounded conductors to a grounded neutral conductor shall be permitted for the purpose of reducing objectionable noise in ~~audio/video production or other similar~~ sensitive electronic equipment locations provided that its use is restricted to areas under close supervision by qualified personnel ~~electronic equipment only~~ and that all of the requirements in Sections 647-3 through 647-7 are met.

~~530-71.~~ 647-3. Wiring Methods.

(a) Panelboards and Overcurrent Protection. Use of standard single-phase panelboards and distribution equipment with a higher voltage rating shall be permitted. The system shall be clearly marked on the face of the panel or on the inside of the panel doors. Common-trip two-pole circuit breakers that are identified for operation at the system voltage shall be provided for both ungrounded conductors in all feeders and branch circuits.

(b) Junction Boxes. All junction box covers shall be clearly marked to indicate the distribution panel and the system voltage.

(c) Color Coding. All feeders and branch-circuit conductors installed under this section shall be identified as to system at all splices and terminations by color, marking, tagging or equally effective means. The means of identification shall be posted at each branch-circuit panelboard and at the disconnecting means for the building.

(d) Voltage Drop. The voltage drop on any branch circuit shall be limited as follows: ~~The voltage drop on any branch circuit shall not exceed 1.5 percent. The combined voltage drop of feeder and branch circuit conductors shall not exceed 2.5 percent.~~

(1) The voltage drop on branch circuits supplying equipment connected using wiring methods in Chapter 3 shall not exceed 1.5 percent.

(2) The voltage drop in branch circuits supplying receptacle outlets shall not exceed 1 percent. For the purposes of making this calculation, the load connected to the receptacle outlet shall be considered to be 50 percent of the branch circuit rating.

(FPN): The purpose of this provision is to limit voltage drop to 1.5 percent where portable cords may be used as a means of connecting equipment.

647-4. 3-phase Systems. Where 3-phase power is supplied, a separately derived 6-phase "Wye" system with 60 volts to ground installed under this article shall be configured as three separately derived 120-volt single-phase systems having a combined total of no more than six main disconnect.

~~530-72.~~ 647-5. Grounding.

(a) General. The system shall be grounded as provided in Section 250-26 as a separately derived single-phase 3-wire system.

(b) Grounding Conductors Required. Permanently wired utilization equipment and receptacles shall be grounded by means of an equipment grounding conductor run with the circuit conductors to an equipment grounding bus prominently marked "Technical Equipment Ground" in the originating branch-circuit panelboard. The grounding bus shall be connected to the grounded conductor on the line side of the separately derived system's disconnecting means. The grounding conductor shall not be smaller than that specified in Table 250-95 and run with the feeder conductors. The technical equipment grounding bus need not be bonded to the panelboard enclosure. Other grounding methods authorized elsewhere in this Code shall be permitted where the impedance of the grounding return path does not exceed the impedance of equipment grounding conductors sized and installed in accordance with this article.

~~Exception: Other grounding methods authorized elsewhere in this Code shall be permitted where the impedance of the grounding return path does not exceed the impedance of equipment grounding conductors sized and installed in accordance with Part C of this article.~~

(FPN No. 1): See Section 250-95 for equipment grounding conductor sizing requirements where circuit conductors are adjusted in size to compensate for voltage drop.

(FPN No. 2): These requirements limit the impedance of the ground fault path where only 60 volts applies to a fault condition instead of the usual 120 volts.

~~530-73.~~ 647-6. Receptacles.

(a) General. Where receptacles are used as a means of connecting equipment, the following conditions shall be met:

(1) All 15 and 20 Amp. receptacles shall be GFCI protected.

(2) All outlet strips, adapters, receptacle covers and faceplates shall be marked as follows:

WARNING - TECHNICAL POWER
Do not connect to lighting equipment.
For electronic equipment use only.
60/120 V.1Ø AC
GFCI protected

(3) A 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet having one of its current carrying poles connected to a grounded circuit conductor shall be located within ~~6 ft. (1.83 m)~~ 2 ft. (.61 m) of all permanently installed 15- or 20-ampere-rated 60/120-volt technical power-system receptacles.

(4) All 125-volt receptacles used for 60/120 -volt technical power shall have a unique configuration and be identified for use with this class of system. All 125-Volt, single phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted on portable distribution equipment, in machine rooms, control rooms, equipment rooms, equipment racks and other similar locations that are restricted to use by qualified personnel.

~~Exception: 125 Volt, single phase, 15 or 20 ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks and other similar locations that are restricted to use by qualified personnel.~~

(b) Isolated ground receptacles. Isolated ground receptacles shall be permitted as described in Section 250-74 Exception No. 4, however, the branch circuit equipment grounding conductor shall be terminated as required in Section ~~530-72(b)~~ 647-5(b).

647-7. Lighting Equipment. Lighting equipment installed under this article shall meet the following conditions (a-c):

(a) Disconnecting Means. All lighting equipment shall have a disconnecting means that simultaneously opens all ungrounded conductors, and shall be located within sight or be capable of being locked in the open position.

(b) Fixtures. All lighting fixtures shall be permanently installed. Portable lighting equipment shall be permitted on sound stages and in theaters provided that the equipment is restricted to use by qualified personnel.

(c) Exposed Screw-shell. Lighting fixtures installed under this section shall not have an exposed lamp screw-shell.

The Panel's comments all seemed to concur that there were other venues where use of this class of system is appropriate, however, rejection of the proposal has limited the application only to locations where it is currently approved. I understand the Panel's concerns about safety issues, particularly ones where types of occupancies are involved and where high circuit impedance could present a problem. Herein, I have attempted to resolve these issues.

SUBSTANTIATION: In the original proposal under 647-1, the language that included "all occupancies" for this class of system overlooked several important issues regarding residential use. Change of occupants and the similarity between this system and the more familiar 120-volt neutral wired circuits presents an unusual set of problems, difficult to address in common residential occupancies. Therefore, I agree with the committee that this class of system should be limited to commercial and industrial occupancies until such time as the issues relating to safe residential applications are resolved. I have now revised the wording of proposed 647-1 to cover only commercial and industrial occupancies.

Another of the committee's concerns was the application of a 60-volt-to-ground system where a large circuit impedance could inhibit the actuation of overcurrent devices. To resolve this issue, I have added to 647-3(d), provisions which further restrict voltage drop particularly where cord-connected equipment is likely to be used with receptacle outlets. (A 40-ft branch circuit of 12 ga. THHN wire with 2 18 ga x 6 ft extension cords operating 5 PC's yields approximately a 1.6-volt drop or about 1.3 percent.)

I think that qualified installers and technicians need to be especially mindful of the importance of voltage drop, at least until there is more familiarity with this class of system. Insofar as including a FPN in 647-3(d) is concerned, I don't want to see the NEC expanded into a multivolume set anymore than anyone else, however I think that it is appropriate to approach each issue on a case per case basis, this being a case where clarity and understanding of the system's safe application is more important than brevity.

Regarding 647-7: It is widely known than many types of lighting equipment (fluorescent lighting, dimmer controls, etc.) in addition to electronic power supplies are the cause of much electrical interference in the form of reactive currents, grounding currents, etc. Furthermore, the propagation of these types of electrical interference are responsible for many instances of sensitive electronic equipment malfunction. Proposed Sections 647-3(d) and 647-7 have been modified and/or included with this comment to address relevant safety issues.

Regarding 647-7(b), Exception: The proposed 647-7(b) is specific as to where portable lighting equipment is allowed. I believe that the Committee's objection to the exception in proposed 647-7(b) focused mainly on the danger of high circuit impedance and voltage drop. However, I also believe that use of this class of system would be of great benefit in theaters and sound stages where noise from lighting controls often inhibits the performance of sensitive sound and videotaping equipment. With the additional provisions now added to proposed 647-3(d), I feel that the intent of the Code to limit voltage drop has been adequately stated. So, in light of these new provisions and the usefulness of this system as a means of reducing electrical interference originating in stage lighting equipment, I have not changed the language (of the exception) in proposed 647-7(b). However, if the Panel chooses to reject this provision and/or any other part of proposed 647-7, I feel that it would be appropriate for the Panel to accept this comment on the original proposal in principle and in part.

Note: With further regard to 647-7; recently I was approached by a manufacturer of power and lighting-control equipment, a company that produces solid-state controllers and dimmers. There is knowledge of this proposal among these companies. Many are watching this proposal carefully because a 2-pole disconnecting means for lighting-control equipment (required in 647-7(a)) is compatible with universally accepted standards. Should this provision be accepted, manufacturers will likely adapt their domestic equipment to meet a more internationally compatible design. This will also be helpful in international touring situations.

With respect to proposed 647-4: This provision is intended to provide an alternate method of single-phase distribution in environments where sensitive equipment is commonly connected to a 120/208-volt 3-phase system. This system has been applied in several locations with encouraging results. Two companies that are using this configuration are: AMS Productions, Dallas, Texas, a video post-production company; and Argyle Broadcasting, KITV, Honolulu, Hawaii, an ABC affiliate and notably the first TV station transmitting a full-time digital television signal. Both companies are using a 112.5 KVA 6-phase 60-volt-to-ground system as outlined in proposed 647-4.

Conclusion: Not only in sound and video applications, but in communications, EDP environments, medical, computer-assisted manufacturing and others, electrical noise is an ongoing problem. With appropriate safety measures included in a new Article 647, the benefits now realized by the industries under Article 530, Part G could be applied to other venues.

PANEL ACTION: Accept in Principle in Part.

PANEL STATEMENT: Refer to the panel action and statement of Proposal 15-72.

15- 72 - (530 Part G):

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee rejects the Panel Action.

The Technical Correlating Committee directs that the Scope be revised to read as follows: "This article covers the installation and wiring of separately derived systems operating at 120 volts line-to-line and 60 volts to ground for sensitive electronic equipment."

The Technical Correlating Committee directs the Panel to place the limitation to commercial and industrial occupancies elsewhere in the article.

This action will be considered by the Panel as a Public Comment.

SUBMITTER: Martin Glasband, Equi-Tech Corp.

RECOMMENDATION: Revise text as follows:

~~Article 530 — Motion Picture and Television Studios and Similar Locations~~

~~G. Separately Derived Systems with 60 Volts to Ground~~

Article 647 — Sensitive Electronic Equipment

647-1. Scope. The provisions of this article shall apply to commercial and industrial occupancies where the use of sensitive electronic equipment is connected to a separately derived system operating at 120 volts line-to-line and 60 volts to ground.

~~530-70.~~ 647-2. General. Use of a separately derived 120-volt single-phase 3-wire system with 60 volts on each of two ungrounded conductors to a grounded neutral conductor shall be permitted for the purpose of reducing objectionable noise in ~~audio/video production or other similar~~ sensitive electronic equipment locations provided that its use is restricted to areas under close supervision by qualified personnel ~~electronic equipment only~~ and that all of the requirements in Sections 647-3 through 647-7 are met.

~~530-71.~~ 647-3. Wiring Methods.

(a) Panelboards and Overcurrent Protection. Use of standard single-phase panelboards and distribution equipment with a higher voltage rating shall be permitted. The system shall be clearly marked on the face of the panel or on the inside of the panel doors. Common-trip two-pole circuit breakers that are identified for operation at the system voltage shall be provided for both ungrounded conductors in all feeders and branch circuits.

(b) Junction Boxes. All junction box covers shall be clearly marked to indicate the distribution panel and the system voltage.

(c) Color Coding. All feeders and branch-circuit conductors installed under this section shall be identified as to system at all splices and terminations by color, marking, tagging, or equally effective means. The means of identification shall be posted at each branch-circuit panelboard and at the disconnecting means for the building.

(d) Voltage Drop. The voltage drop on any branch circuit shall be limited as follows: ~~The voltage drop on any branch circuit shall not exceed 1.5 percent. The combined voltage drop of feeder and branch circuit conductors shall not exceed 2.5 percent.~~

(1) The voltage drop on branch circuits supplying equipment connected using wiring methods in Chapter 3 shall not exceed 1.5 percent.

(2) The voltage drop on branch circuits supplying receptacle outlets shall not exceed 1 percent. For the purposes of making this calculation, the load connected to the receptacle outlet shall be considered to be 50 percent of the branch circuit rating.

FPN: The purpose of this provision is to limit voltage drop to 1.5 percent where portable cords may be used as a means of connecting equipment.

647-4. 3-phase Systems. Where 3-phase power is supplied, a separately derived 6-phase "Wye" system with 60 volts to ground installed under this article shall be configured as three separately derived 120-volt single-phase systems having a combined total of no more than six main disconnects.

~~530-72.~~ 647-5. Grounding.

(a) General. The system shall be grounded as provided in Section 250-26 as a separately derived single-phase 3-wire system.

(b) Grounding Conductors Required. Permanently wired utilization equipment and receptacles shall be grounded by means of an equipment grounding conductor run with the circuit conductors to an equipment grounding bus prominently marked "Technical Equipment Ground" in the originating branch-circuit panelboard. The grounding bus shall be connected to the grounded conductor on the line side of the separately derived system's disconnecting means. The grounding conductor shall not be smaller than that specified in Table 250-95 and run with the

feeder conductors. The technical equipment grounding bus need not be bonded to the panelboard enclosure. Other grounding methods authorized elsewhere in this Code shall be permitted where the impedance of the grounding return path does not exceed the impedance of equipment grounding conductors sized and installed in accordance with Part G of this article.

FPN No. 1: See Section 250-95 for equipment grounding conductor sizing requirements where circuit conductors are adjusted in size to compensate for voltage drop.

FPN No. 2: These requirements limit the impedance of the ground fault path where only 60 volts applies to a fault condition instead of the usual 120 volts.

~~530-73.~~ 647-6. Receptacles.

(a) General. Where receptacles are used as a means of connecting equipment, the following conditions shall be met:

(1) All 15 and 20 Amp. receptacles shall be GFCI protected.

(2) All outlet strips, adapters, receptacle covers, and faceplates shall be marked as follows:

WARNING - TECHNICAL POWER
Do not connect to lighting equipment.
For electronic equipment use only.
60/1120 V. 1øAC
GFCI protected

(3) A 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet having one of its current carrying poles connected to a grounded circuit conductor shall be located within 6 ft (1.83 m) of all permanently installed 15- or 20-ampere-rated 60/120-volt technical power-system receptacles.

(4) All 125-volt receptacles used for 60/120-volt technical power shall have a unique configuration and be identified for use with this class of system. 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks, and other similar locations that are restricted to use by qualified personnel.

(b) Isolated Ground Receptacles. Isolated ground receptacles shall be permitted as described in Section 250-74, Exception No. 4; however, the branch circuit equipment grounding conductor shall be terminated as required in Section ~~530-72(b)~~ 647-5(b).

647-7. Lighting Equipment. Lighting equipment installed under this article for the purpose of reducing electrical noise originating from lighting equipment shall meet the following conditions (a-c):

(a) Disconnecting Means. All lighting equipment shall have a disconnecting means that simultaneously opens all ungrounded conductors, and shall be located within sight or be capable of being locked in the open position.

(b) Fixtures. All lighting fixtures shall be permanently installed.

(c) Exposed Screw-shell. Lighting fixtures installed under this section shall not have an exposed lamp screw-shell.

SUBSTANTIATION: Held over from the previous code cycle, the submitter has had time to accumulate much more information regarding the application of 120V "balanced power" as it has come to be known in the industries where it is being extensively used.

Most all of the findings relate to the use of balanced power in digitally based systems where a noted decrease in digital error rates and "digital jitter" have been noted. As is true with most all digitally based signal processing equipment, performance is often affected by power distortion and noise. We have noted a great improvement in data accuracy and bandwidth, both very encouraging specifications to consider.

There are no known cases where use of this system has resulted in injury or fire as a result of applying the wiring methods outlined in 530 "G." I have heard of no case where overcurrent devices failed to operate despite the comments of the few panel members who voiced their concerns. The voltage drop allowed in the proposal is only 1/2 that (or less) of common 120-volt branch circuits having a grounded conductor.

Here, I have made a few revisions to the previously submitted Proposal 15-94, largely based on the comments by Mr. Vannice. The exception language in proposed 647-7b has been removed entirely. I agree with Mr. Vannice that more study is required before 60-volt to ground power can be safely used with any type of portable lighting equipment in any given situation. The remaining parts of the proposal that deal with permanently installed lighting equipment should be sufficient to correct electrical noise problems associated with lighting equipment in most areas where sensitive electronics operates.

One of the previous comments made against the previous proposal regarding lighting dimmers (et. al.) suggested that there are no problems associated with noise from such equipment. I completely disagree with that comment. Lighting control equipment noise is notorious for causing problems with sound equipment in the live sound reinforcement industry. Having some means to address the issue will discourage sound technicians from lifting grounding conductors, a common but dangerous practice.

Another hidden advantage of this wiring method which is not immediately apparent is how the balanced architecture of the system keeps power factor high on the primary side of the transformer. This is based on the formula $kW^2 + kVAR^2 = kVA^2$. The balanced system nulls out reactive current at the center tap of the secondary winding. This common mode cancellation is a very effective way of reducing reactive currents, harmonic distortion, and other power related problems associated with the use of nonlinear reactive loads.

It was the opinion of every panel member that limiting this wiring method only to television, theater, etc. venues is a very narrow point of view. It would be wise for the electrical industry to keep pace with advancing technology in the many areas of industry that would benefit from such a system.

PANEL ACTION: Accept in Principle in Part.

Revise the submitter's recommendation to read as follows:

Revise text as follows:

Delete Part G of Article 530.

Provide a new Article 647 to read as follows: Article 647 — Sensitive Electronic Equipment

647-1. Scope. The provisions of this article shall apply to commercial and industrial occupancies where the use of sensitive electronic equipment is connected to a separately derived system operating at 120 volts line-to-line and 60 volts to ground.

530-70. 647-3 General. Use of a separately derived 120-volt single-phase 3-wire system with 60 volts on each of two ungrounded conductors to a grounded neutral conductor shall be permitted for the purpose of reducing objectionable noise in audio/video production or other similar sensitive electronic equipment locations provided that its use is restricted toareas under close supervision by qualified personnel electronic equipment only and that all of the requirements in Sections 647-4 through 647-8 are met.

530-71. 647-4. Wiring Methods.

(a) Panelboards and Overcurrent Protection. Use of standard single-phase panelboards and distribution equipment with a higher voltage rating shall be permitted. The system shall be clearly marked on the face of the panel or on the inside of the panel doors. Common-trip two-pole circuit breakers that are identified for operation at the system voltage shall be provided for both ungrounded conductors in all feeders and branch circuits.

(b) Junction Boxes. All junction box covers shall be clearly marked to indicate the distribution panel and the system voltage.

(c) Color Coding. All feeders and branch-circuit conductors installed under this section shall be identified as to system at all splices and terminations by color, marking, tagging, or equally effective means. The means of identification shall be posted at each branch-circuit panelboard and at the disconnecting means for the building.

(d) Voltage Drop. The voltage drop on any branch circuit shall be limited as follows: The voltage drop on any branch circuit shall not exceed 1.5 percent. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.5 percent.

(1) Fixed Equipment. The voltage drop on branch circuits supplying equipment connected using wiring methods in Chapter 3 shall not exceed 1.5 percent. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.5 percent.(2) Cord-connected Equipment. The voltage drop on branch circuits supplying receptacles shall not exceed 1 percent. For the purposes of making this calculation, the load connected to the receptacle outlet shall be considered to be 50 percent of the branch circuit rating. The combined voltage drop of feeder and branch-circuit conductors shall not exceed 2.0 perce

FPN: The purpose of this provision is to limit voltage drop to 1.5 percent where portable cords may be used as a means of connecting equipment.

647-5. 3-phase Systems. Where 3-phase power is supplied, a separately derived 6-phase "Wye" system with 60 volts to ground installed under this article shall be configured as three separately derived 120-volt single-phase systems having a combined total of no more than six main disconnects.

530-72. 647-6 Grounding.

(a) General. The system shall be grounded as provided in Section 250-30 as a separately derived single-phase 3-wire system.

(b) Grounding Conductors Required. Permanently wired utilization equipment and receptacles shall be grounded by means of an equipment grounding conductor run with the circuit conductors to an equipment grounding bus prominently marked "Technical Equipment Ground" in the originating branch-circuit panelboard. The grounding bus shall be connected to the grounded conductor on the line side of the separately derived system's disconnecting means. The grounding conductor shall not be smaller than that specified in Table 250-122 and run with the feeder conductors. The technical equipment grounding bus need not be bonded to the panelboard enclosure. Other grounding methods authorized elsewhere in this Code shall be permitted where the impedance of the grounding return path does not exceed the impedance of equipment grounding conductors sized and installed in accordance with this article.

FPN No. 1: See Section 250-122 for equipment grounding conductor sizing requirements where circuit conductors are adjusted in size to compensate for voltage drop.

FPN No. 2: These requirements limit the impedance of the ground fault path where only 60 volts applies to a fault condition instead of the usual 120 volts.

530-73. 647-7. Receptacles.

(a) General. Where receptacles are used as a means of connecting equipment, the following conditions shall be met:

(1) All 15 and 20 Amp. receptacles shall be GFCI protected.

(2) All outlet strips, adapters, receptacle covers, and faceplates shall be marked as follows:

WARNING - TECHNICAL POWER
Do not connect to lighting equipment.
For electronic equipment use only.
60/120 V. 1øAC
GFCI protected

(3) A 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlet having one of its current carrying poles connected to a grounded circuit conductor shall be located within 1.8 m (6 ft) of all permanently installed 15- or 20-ampere-rated 60/120-volt technical power-system receptacles.

(4) All 125-volt receptacles used for 60/120-volt technical power shall have a unique configuration and be identified for use with this class of system. All 125-volt, single-phase, 15- or 20-ampere-rated receptacle outlets and attachment plugs that are identified for use with grounded circuit conductors shall be permitted in machine rooms, control rooms, equipment rooms, equipment racks, and other similar locations that are restricted to use by qualified personnel.

(b) Isolated Ground Receptacles. Isolated ground receptacles shall be permitted as described in Section 250-146(d); however, the branch circuit equipment grounding conductor shall be terminated as required in Section 530-72(b) 647-6(b) .

647-8. Lighting Equipment. Lighting equipment installed under this article for the purpose of reducing electrical noise originating from lighting equipment shall meet the following conditions (a-c):

(a) Disconnecting Means. All lighting equipment shall have a disconnecting means that simultaneously opens all ungrounded conductors, and shall be located within sight or be capable of being locked in the open position.

(b) Luminaires. All luminaires shall be permanently installed, listed and ballast operated.

(c) Screw-shell. Luminaires installed under this section shall not have an exposed lamp screw-shell.

PANEL STATEMENT: The revised text meets the intent of the submitter.

The part rejected is the deletion of Article 530.

The deletion of the voltage drop for feeders is also rejected.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NOT RETURNED: 1 Kalbfeld

COMMENT ON AFFIRMATIVE:

GLENN: I am voting in favor of the panel action with the following comment:

The use of the term "Sensitive" in this new article is undefined and unclear. It would be better to drop the word "sensitive" and just have an article for "Electronic Equipment".

(Log #3276)

15- 73 - (530-73(a)(2)): Accept

Note: The Technical Correlating Committee understands that this action modifies the text accepted in Proposal 15-72.

SUBMITTER: Alan Manche, Square D Co.

RECOMMENDATION: Revise 530-73(a)(2) with the additions (underlined) and deletions (strike through) as shown. The entire text is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

2. All outlet strips, adapters, receptacle covers, and faceplates shall be marked ~~as follows~~ with the following words or equivalent:

WARNING-TECHNICAL POWER
Do not connect to lighting equipment
For electronic equipment use only
60/120 volt 1ph ac
GFCI protected.

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19

VOTE ON PANEL ACTION:

AFFIRMATIVE: 17

NEGATIVE: 1

NOT RETURNED: 1 Kalbfeld

EXPLANATION OF NEGATIVE:

HIRSCHLER: A mandatory warning should not be permitted to have "OR EQUIVALENT" wording. This is unenforceable, as it cannot be decided what equivalent wording is. For example, it is unclear to me what wording would be "equivalent" to the mandated "WARNING - TECHNICAL POWER" without changing the meaning.

COMMENT ON AFFIRMATIVE:

VANNICE: Upon accepting Proposal 15-72, this proposal now refers to Section 647-7(a)(2).

ARTICLE 540 — MOTION PICTURE PROJECTORS

(Log #2188)

15- 74 - (540): Accept

Note: The Technical Correlating Committee advises that Article Titles are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.

SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.

RECOMMENDATION: Revise as follows:

ARTICLE 540 — Motion Picture Projection Rooms ~~Projectors~~

SUBSTANTIATION: This change more accurately agrees with the title of Chapter 5. It now is an occupancy rather than just a piece of equipment. This is also the first item mentioned in Section 540-1 Scope, then the scope continues and defines the associated equipment, motion picture projectors being one, that is part of this article.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 18

NOT RETURNED: 1 Kalbfeld

(Log #485)

15- 75 - (540-2, 540-12): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: 540-2 - revise as follows:

"540-2. Professional Projector. A type of projector using 35- or 70-mm film that has a minimum width of 35 mm (1 3/8 in.) 1 ~~3/8~~

~~inch (35 mm)~~ and has on each edge 212 perforations per meter (5.4 perforations per inch), or a type using carbon arc, xenon, or other light source equipment that develops hazardous gases, dust, or radiation."

540-12 - change "30 in. (762 mm)" to "750 mm (30 in.)"

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kalbfeld

(Log #486)

15- 76 - (540-11(a)(6)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise second sentence as follows:
"(6) Wire Screens or Perforated Metal. Have wire screens or perforated metal placed at the commutator of brush ends. No dimension of any opening in the wire screen or perforated metal shall exceed 1.27 mm (0.05 in.) ~~0.05 in. (1.27 mm)~~, regardless of the shape of the opening and of the material used."
SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kalbfeld

(Log #1086)

15- 77 - (540-13): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 8" to "8 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 19
VOTE ON PANEL ACTION:
AFFIRMATIVE: 18
NOT RETURNED: 1 Kalbfeld

ARTICLE 545 — MANUFACTURED BUILDING

(Log #2172)

19- 3 - (545): Accept
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Article 545 — Manufactured Buildings
~~A. General~~
SUBSTANTIATION: Parts should not be used in the article because there is only one part. The NEC Style Manual 2.1.4 states, "If an article is sufficiently large, it shall be permitted to be subdivided into parts...". The use of only one part does not subdivide the article.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #1087)

19- 4 - (545-4(b)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 10" to "10 AWG".
SUBSTANTIATION: To provide consistency throughout the Code The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: The NEC Style Manual does not specify the language used one way or another. The NFPA Manual of Style, seems to prefer 10 AWG. Product standards use 10 AWG or 10 AWG 110-6 says that the conductor sizes are expressed in AWG or in circular mils so the AWG is implied The panel recognizes that the TCC may desire to take a different action to be consistent with the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #2447)

19- 5 - (545-4(c) (New)): Reject
SUBMITTER: Patrick S. Ouillette, Maine Dept. of Professional and Financial Regulation
RECOMMENDATION: Add new text to read as follows:
(c) Use of Notches in Wood. Where notches in accordance with Section 300-4(a)(2) are used on the exterior side of wood studs of outside walls of dwelling units, the manufacturer of the building shall provide a label with the structure that describes the notches and that shows the locations of the notches. The label provided shall be affixed to the electrical service or distribution equipment.
SUBSTANTIATION: Some manufacturers of modular homes (manufactured buildings) elect to cut notches in the exterior side of outside wall wood studs. This makes for ease of wiring within the manufacturing plant. The notches are covered with steel plates as required.

I inspected a modular home where nearly every steel plate covering the wiring notches in the structure had been bent inward (in some instances pushed tightly against the back side of the notch) as a result of the installation of an additional layer of structural sheathing, field installed with a power nailer. This custom work in the field is not the norm for modular housing. However, there is an increasing trend toward ordering a home without siding. Depending on the type of siding applied, power fastening of the siding could certainly be expected. The photos I have provided show serious damage to the NM cables by screws and nails, many of which first penetrated the steel plates. The number of cables passing through some of the notches allowed little chance for a cable to be shifted to one side or the other with the movement of the bending plates, as was the case in some of the notches containing only a single cable. This "bundling" of cables through some of the notches borders on a violation of 310-15(b)(2)(a), particularly when considering the wall insulation.

All manufacturers of modular housing that I am aware of ship installation/set-up instructions with their homes for field use. A label describing and locating any exterior wiring notches used could easily be included with these instructions. The wiring in the home was never energized. The problem was uncovered when an area of the exterior wall was open for the field installation of a deck. Nearly the entire home was gutted and rewired using new cables through bored studs. [See submitter's proposal with photos for Section 550-10(c), relating to manufactured (mobile) homes.]

Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The problem addressed in the recommendation should be addressed by enforcement of existing methods and installation standards. The proposed solution would not be effective. Steel plates have been shown to be effective protection for common fastening methods.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9

AFFIRMATIVE: 9

(Log #937)

19- 6 - (545-5): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
~~Service Entrance Conductors.~~ Supply Conductors. ~~Service entrance conductors shall meet the requirements of Article 230.~~ Provisions shall be made to route the service-entrance, service-lateral, feeder, or branch-circuit supply conductors ~~from the service equipment to the point of attachment of the service drop or service lateral~~ to the service or building disconnecting means.
SUBSTANTIATION: A manufactured building may have supply conductors which are not service-entrance conductors, such as feeders or branch circuits as covered in Article 225, which may be overhead or underground. These conductors should warrant the same provisions. Service-laterals may terminate at service equipment, with no service-entrance conductors.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #938)

19- 7 - (545-6): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Installation of Service-Entrance Conductors. Service-entrance conductors shall meet the requirements of Article 230 and shall be installed after erection at the building site except where point of attachment to the service-drop or service-lateral is known prior to manufacture.
Delete exception.
SUBSTANTIATION: Editorial. Incorporates exception into the rule in sentence form and indicates what point of attachment is intended.
PANEL ACTION: Reject.
PANEL STATEMENT: Given the language of 90-3 , the reference to Artcle 230 is not needed. The existing exception provides sufficient clarity.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:

(Log #518)

19- 8 - (545-9(b)): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: In Section 545-9(b), replace "100 in.^{3} (1640 cm^3)" with "1650 cm^3 (100 in.^{3})" throughout.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #939)

19- 9 - (545-12): Accept in Principle in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Grounding Electrode Conductor. Provisions shall be made to route a grounding ~~electrode~~ conductor from the point of attachment to an alternating-current service or feeder or branch circuit supply to the point of attachment to the grounding electrode.
SUBSTANTIATION: Service equipment, per definition, limits the point of attachment whereas Section 250-24(a)(1) permits attachment at any point on the service. I believe some utilities require (or permit) attachment at the service head. If this provision is necessary should it not include a grounding conductor required by Section 250-32? Section 250-162 would govern dc services.
PANEL ACTION: Accept in Principle in Part.
Revise to read as follows:
"Grounding Electrode Conductor or Grounding Conductor. Provisions shall be made to route a grounding electrode conductor or grounding conductor from the service, feeder, or branch circuit supply to the point of attachment to the grounding electrode."
PANEL STATEMENT: The rejected phrase unneccesarily limits the Code user. The title and text were changed to be consistent with 250-32(f) and the concerns of the submitter.

ARTICLE 547 — AGRICULTURAL BUILDINGS

(Log #3678)

19- 10 - (547-1): Reject
SUBMITTER: Leonard F. Devine, Jr., W. Palm Beach County Bldg & Zoning, FL
RECOMMENDATION: Add new text to read as follows:
547-1. Scope. The provisions of this article shall apply to the following agricultural buildings of commercial use or that part of a building or adjacent areas of similar or like nature as specified in (a) and (b).
SUBSTANTIATION: The problem is that all to often we are asking people with a dog cage or a small barn in their back yard to provide an equipotential plane for such a structure when in fact we may be doing more harm than good. It is not unusual in some areas of the country for someone to build a barn to hold a few horses and because of the way the barn is constructed open dirt stalls and concrete walkways around the stall area that leads directly onto a dirt area outside the concrete to ask them to install up to 300 ground rods, bonding them all together. This certainly is an overkill and has the potential to cause harm to animals if the ground rods should become exposed over time.
PANEL ACTION: Reject.
PANEL STATEMENT: The scope statements are the responsibility of the TCC. Additionally, the term "commercial" is not defined and its undefined use would create confusion.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #4123)

19- 11 - (547-2): Accept
Note: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal regarding the renumbering of the sections, combining existing 547-2 with another section, or deleting 547-2. The Technical Correlating Committee directs the Panel to correlate the action on this Proposal with the actions on Proposals 19-21 and 19-28. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Jonathan R. Althouse, Michigan State University
RECOMMENDATION: Create a new section 547-2 Definitions. Renumber the present sections or combine it with another section. Move "Distribution Point" from the end of 547-8(c) to become 547-2(a) and move "Equipotential Plane" from 547-9(a) to 547-2(b).
SUBSTANTIATION: All definitions need to be at the beginning of the Article for ease of locating them and to be consistent with other articles.
PANEL ACTION: Accept.
PANEL STATEMENT: There will be editorial changes in the recommendation made to conform to the requirements of the style manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #940)

19- 12 - (547-4): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first sentence:
Multiconductor Type UF, copper Type SE, Article 344 or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring method employed.
SUBSTANTIATION: Editorial. Multiconductor cable should be specified, if intended. The reference to Article 320 covers the use of single-conductor Type UF cables and provides for specific installation requirements.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing Code is sufficiently clear.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #2573)

19- 13 - (547-4(a)): Accept in Principle
SUBMITTER: J. Philip Simmons, Nat'l Armored Cable Manufacturers Assn.
RECOMMENDATION: Revise existing section as follows:
(a) Wiring Systems. Types UF, NMC, copper SE cables, Type MC cable, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring methods employed. Article 320 and Article 502 wiring methods shall be permitted for areas described in Section 547-1(a).
SUBSTANTIATION: Listed Type MC cable is manufactured with an overall corrosion resistant, moisture impervious nonmetallic jacket. This product is suitable for installations in agricultural buildings. See Sections 334-4 and 334-22 for information on supplemental protection of Type MC cable.
PANEL ACTION: Accept in Principle.
Revise to add the text "jacketed" before "Type MC cable" in the recommendation.
PANEL STATEMENT: Adding the term jacketed would ensure that the cable is adequately protected.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #3723)

19- 14 - (547-4(a)): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 7-12. This action will be considered by the Panel as a Public Comment. The Technical Correlating Committee understands that the action on this Proposal further modifies the action on Proposal 19-13.
SUBMITTER: Barry Bauman, Alliante Energy/Rep. Alliant Energy/Rep. American Society of Agricultural Engineers
RECOMMENDATION: Revise text to read as follows:
(a) Wiring Systems. Types UF, NMC, copper SE cables, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring methods employed. ~~Article 320 and~~ Article 502 wiring methods shall be permitted for areas described in Section 547-1(a).
SUBSTANTIATION: Open wiring on insulators is not appropriate in the interior of modern agricultural buildings. It is being used to avoid more appropriate wiring methods such as UF cable and nonmetallic conduit.
A similar proposal is being submitted for 320-3.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

RECOMMENDATION: In Section 547-4(b), replace "8 in. (203 mm)" with "200 mm (8 in.)" and replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #2412)

19- 16 - (547-4(c)): Accept in Principle in Part
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise as shown below:
547-4(c). Equipment Enclosures, Boxes, Conduit Bodies, and Fittings. All equipment enclosures, boxes, conduit bodies, and fittings shall comply with ~~Section 547-5~~ (1) through (3) below.
(1) Excessive Dust. Equipment enclosures, boxes, conduit bodies, and fittings installed in areas of buildings where excessive dust may be present shall be designed to minimize the entrance of dust and shall have no openings (such as holes for attachment screws) through which dust could enter the enclosure.
(2) Damp or Wet Locations. In damp or wet locations, equipment enclosures, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the enclosure, box , conduit body, or fitting. In wet locations, including normally dry or damp locations where surfaces are periodically washed or sprayed with water, boxes, conduit bodies, and fittings and shall be listed for use in wet locations, and equipment enclosures shall be weatherproof.
(3) Corrosive Atmosphere. Where wet dust, excessive moisture, corrosive gases or vapors, or other corrosive conditions may be present, equipment enclosures, boxes, conduit bodies, and fittings shall have corrosion resistance properties suitable for the conditions.
FPN No. 1: See Table 430-91 for appropriate enclosure type designations.
FPN No. 2: Aluminum and magnetic ferrous materials may corrode in agricultural environments.
SUBSTANTIATION: This proposal relates to Section 547-5, and should be coordinated with submitter's proposal for that section.
The appropriate place for specifications for boxes and fittings would seem to be under the heading "(c) Boxes and Fittings" in this section, not Section 547-5(a) and (b), which must be forward-referenced. The corresponding existing requirements under 547-5(a) and (b) are proposed for deletion under a separate proposal.
Equipment enclosures and conduit bodies should be referred to in the headings and text because these requirements should apply to them.
Dust, moisture, and corrosive conditions are addressed separately, because, as persons familiar with these locations may have observed, some buildings or building areas may be subject to only dust or excessive moisture, not both.
It is not uncommon to find watertight enclosures (outlet or junction boxes with gasketed covers) partially filled with water due to condensation. Reiterating the requirement of Sections 370-15(a), which applies to boxes, conduit bodies and fittings and 373-2(a), which applies to cabinets and other enclosures provides consistency with those requirements.
Present 547-5(a) refers to "dustproof" enclosures. The term "dustproof" is not used in any other Code article, nor is it used in the UL electrical equipment directory in reference to boxes, fittings, or enclosures or NEMA enclosure type designations. The term "dusttight" could be used, but implies a box listed as dusttight under the Article 100 definition. The language proposed under (1) is similar to that of Section 502-4(b)(1), which addresses Class II, Division 2 locations, and therefore seems appropriate.
PANEL ACTION: Accept in Principle in Part.
Delete the first sentence of the recommendation.
Retain existing FPNs and move to 547-4(c).
Revise text as follows:
"(1) Excessive Dust. Equipment enclosures, boxes, conduit bodies, and fittings installed in areas of buildings where excessive dust may be present shall be dustproof.
(2) Damp or Wet Locations. In damp or wet locations, equipment enclosures, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the enclosure, box , conduit body, or fitting. In wet

locations, including normally dry or damp locations where surfaces are periodically washed or sprayed with water, boxes, conduit bodies, and fittings shall be listed for use in wet locations and equipment enclosures shall be watertight.

(3) Corrosive Atmosphere. Where wet dust, excessive moisture, corrosive gases or vapors, or other corrosive conditions may be present, equipment enclosures, boxes, conduit bodies, and fittings shall be suitable for the conditions encountered in the application."

PANEL STATEMENT: Existing FPNs are clear. The text in (1) through (3) was changed to use existing text that was clear and more accurately describes the equipment enclosure types to be utilized. The first sentence of the proposal is redundant.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 7
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
MCNEIVE: Moisture must be prevented from entering the enclosure. Furthermore, the submitter has introduced a requirement (2) that would prohibit a Type 3R enclosure in a wet location. According to product standards, 3R enclosures can allow moisture to enter, but not interfere with operation of equipment. See negative comment on Proposal 19-18.

(Log #1877)

19- 17 - (547-4(g) (New)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
RECOMMENDATION: Add new paragraph (g) to read as follows:
(g) Electrical Terminations. All electrical terminations subject to corrosive vapor and moisture shall be protected with an electrical termination compound or approved grease.
SUBSTANTIATION: The problem with barn wiring is that metal terminations and connections rot away, especially steel and aluminum. Requiring products such as Penetrox, Noalox, Deox, Oxgard or Contax, or even white lithium grease or silicone grease (as in King connectors) would do more than anything else to stop problems.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation for the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #2413)

19- 18 - (547-5): Accept
SUBMITTER: William E. Bickner, Stillwater, MN
RECOMMENDATION: Revise as shown below:
547-5. Switches, Receptacles, Circuit Breakers, Controllers, and Fuses. Switches, including pushbuttons, relays, and similar devices, receptacles, circuit breakers, controllers, and fuses, ~~including pushbuttons, relays, and similar devices,~~ shall be provided with enclosures as specified in ~~(a) and (b)~~ Section 547-4(c).
~~(a) Excessive Dust and Dust with Water. Buildings described in Section 547-1(a) shall utilize dustproof and weatherproof enclosures.~~
~~(b) Corrosive Atmosphere. Buildings described in Section 547-1(a) shall utilize enclosures suitable for the conditions encountered in the application.~~
~~FPN No. 1: See Table 430-91 for appropriate enclosure type designations.~~
~~FPN No. 2: Aluminum and magnetic ferrous materials may corrode in agricultural environments.~~
SUBSTANTIATION: Some material proposed to be deleted by this proposal is proposed to be modified and moved to Section 547-4(c) under submitter's proposal for that section, so the two proposals should be coordinated.
Receptacles should be included in the list of equipment covered by this section, as they are not covered elsewhere in Article 547. The phrase "including pushbuttons, relays, and similar devices" refers to switching devices and should follow "switches" in the list.
The appropriate place for specifications for boxes and fittings would seem to be under the heading "(c) Boxes and Fittings" in Section 547-4(c), not Section 545-5(a) and (b), which must be forward- referenced. The reference here is changed to correspond with changes proposed for Section 547-4(c).
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 7
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
MCNEIVE: Relocating text from 547-5 to 547-4(c) does not contribute to usability of the Code, since 547-4(c) addresses wiring methods. See Proposal 19-16.

(Log #CP1902)

19- 18a - (547-8): Accept
Note: It was the action of the Technical Correlating Committee that further consideration be given to the affirmative comments expressed in the voting. This action will be considered by the panel as a public comment. The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual regarding references to entire articles.
SUBMITTER: CMP 19
RECOMMENDATION: Text to read as follows:
547-8. Electrical Supply to Building or Structures from a Distribution Point
(A) Main Disconnect. A disconnecting means shall be installed at the distribution point when two or more agricultural or associated farm dwelling(s) or other buildings are supplied from the distribution point. For the purposes of applying the rules of this Code, this disconnecting means, shall be classified as the service disconnecting means.
(1) Purpose. The disconnecting means shall simultaneously interrupt all ungrounded conductors for the purposes of isolation, system maintenance, emergency disconnection or connection of optional standby systems.
(2) Series Disconnects. Where the serving utility provides a disconnecting means as part of their service requirements and this disconnecting means is determined to meet the requirements of this section, an additional disconnecting means shall not be required.
(3) Rating. The disconnecting means shall be rated for the calculated load as determined by 220 Part D.
(4) Overcurrent. The disconnecting means shall not be required to contain overload protection.
(5) Accessibility. Where not readily accessible, the disconnecting means shall be capable of operation from a readily accessible point.
(6) Grounding. The grounded conductor of the system shall be grounded at the distribution means and be connected to a grounding electrode through a grounding conductor.
(B) Electrical Supply. The buildings shall be permitted to be supplied by either (1) or (2):
(1) Disconnecting Means and Overcurrent Protection Located at the Building(s) or Structure(s). Where the disconnecting means and overcurrent protection are located at the buildings or structures supplied by the conductors, the conductors shall be sized in accordance with Article 220 and installed in accordance with the requirements of Part B of Article 225. Conductors of the supply system shall meet the clearances specified in 225.18 and 230.24(b).
For each building or structure the conditions in either (a) or (b) shall be permitted.
(a) The grounded circuit conductor shall be permitted to be connected to the building disconnecting means and to the grounding electrode system of that building where all the requirements of Section 250-32(b)(2) are met.
(b) A separate equipment grounding conductor shall be run with the supply conductors to the building(s) or structure(s) and the following conditions shall be met:
1. The equipment grounding conductor shall be the same size as the largest supply conductor, if of the same material, or shall be adjusted in size in accordance with the equivalent size columns of Table 250-122 if of different materials.
2. The equipment grounding conductor is bonded to the grounded circuit conductor at the disconnecting means enclosure at the distribution point or at the source of a separately derived system.
3. A grounding electrode system shall be provided in accordance with Part C of Article 250 and connected to the equipment grounding conductor at the building (s) or structure(s) disconnecting means.
4. The grounded circuit conductor shall not be connected to a grounding electrode or to any equipment grounding conductor on the load side of the distribution point.
(2) Disconnecting Means and Overcurrent Protection at the Distribution Point. Where the disconnecting means and overcurrent

protection for each set of feeder conductors is located at the distribution point, feeders to building(s) or structure(s) shall meet the requirements of 250.32 and Article 225 Parts A and B.

FPN. Methods to reduce neutral-to-earth voltages in livestock structures include supplying buildings with four-wire single-phase services, sizing of three-wire service conductors to limit voltage drop to 2 percent, and connecting loads line-to-line.

(C) Underground Equipment Grounding Conductors. Where livestock is housed, any portion of the equipment grounding conductor run underground to the building or structure shall be insulated or covered copper.

SUBSTANTIATION: The purpose and requirements of the main disconnecting means required in the 1999 Code are more clearly defined. The methods of supplying power to buildings covered under this Article are reorganized and restated to more clearly state the requirements of the methods permitted for supplying power. Concepts from proposals 19-19, 19-20, 19-22, 19-23, 19-24 and 19-26 have been incorporated.

PANEL ACTION: Accept.

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

MCNEIVE: The purpose and requirements of the main disconnecting means required in the 1999 Code are more clearly defined. The methods of supplying power to buildings covered under this Article are reorganized and restated to more clearly state the requirements of the methods permitted for supplying power. Concepts from Proposals 19-19, 19-20, 19-22, 19-23, 19-24, and 19-26 have been incorporated.

COMMENT ON AFFIRMATIVE:

MCCULLOUGH: In (A)(6), I believe the word "distribution" in the first sentence should be "disconnecting". The requirement if for grounding at the disconnecting means, which is the whole topic of (A).

(Log #2025)

19- 19 - (547-8): Accept in Principle

SUBMITTER: David A. Kerr, Jr., Friendsville, PA

RECOMMENDATION: Revise text to read as follows:

547-8. Service Equipment, Separately Derived Systems, Feeders, Disconnecting Means, and Grounding. Where one or more agricultural buildings are supplied from a distribution point, the disconnecting means and grounding of services and feeders shall comply with both (a) and (c), or (b).

(a) Service Equipment at a Building(s). Where the service equipment is located at the load end of the service conductors, service equipment grounding shall meet the requirements of Section 250-24. A disconnecting means [see 547-8(c)] shall also be installed at the distribution point when two or more buildings are supplied from that distribution point.

(b) Service Equipment at Distribution Point. No change.

(c) Disconnecting Means Without Overcurrent Protection at the Distribution Point. Where the disconnecting means without overcurrent protection is located at the distribution point and service equipment is located at the building(s), the grounded circuit conductor connection to the grounding electrode shall not be permitted at the building service equipment at each building and all of the following conditions shall be met.

(1) All buildings and premises wiring are under single management.

(2) Listed disconnecting means is provided at the distribution point.

(3) A wire equipment grounding conductor is run with the supply conductors, sized in accordance with Table 250-66.

(4) and (5) No change.

Distribution Point. Also known as yard service or meter pole. No change.

SUBSTANTIATION: (a) and (c) must clearly be used together; (b) is separate. The title of (a) should be "service equipment". Service equipment is defined elsewhere in the code and does not need a confusing restatement in Article 547.

547-8(c)(2) seems to require nonexistent equipment. Service equipment always contains overcurrent protection. What is needed is a listed outdoor disconnect switch.

547-8(c)(3) is crazy. I don't think there is any other place in the code where equipment grounding conductors are required to be the same size as ungrounded conductors. Metal conduit is not reliable. The EGC has to be a wire. The problem with barn wiring is not microvolts or millivolts arising on the wire; it is macrovolts caused by rotted out terminations. Insanely oversized wire will not solve the problem. The solution is a dry location whenever possible and some sort of protective grease. I have often seen tin plating peel right off like a layer of sunburned skin and aluminum and steel rot and break.

The code should use ordinary English words when possible. Normal people refer to yard service as yard service or the meter pole. This should at least be acknowledged in the definition. It's like whirlpool bathtubs in Article 680.

PANEL ACTION: Accept in Principle.

See action on Proposal 19-18a and proposal 19-21.

PANEL STATEMENT: Submitter's concerns regarding distribution point, services, and disconnecting means are covered in Proposal 19-18a and Proposal 19-21.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

(Log #3719)

19- 20 - (547-8): Accept in Principle

SUBMITTER: Barry Bauman, Alliante Energy/Rep. Alliant Energy/Rep. American Society of Agricultural Engineers

RECOMMENDATION: Revise text to read as follows:

547-8. Service Equipment, Separately Derived Systems, Feeders, Disconnecting Means, and Grounding.

General. A disconnecting means shall be installed at the distribution point when two or more buildings are supplied from the distribution point.

Where one or more ~~agricultural (b), or (c). A disconnecting means shall also be installed at the distribution when two or more buildings are supplied from that distribution point~~ buildings are supplied from a distribution point, the disconnection means and grounding of services and feeders shall comply with (a), (b), or (c).

(a) Disconnecting Means and Overcurrent Protection at a Building(s). Where the service disconnecting means and overcurrent protection are located at the ~~load end of the service conductors~~ buildings served, service equipment grounding shall meet the requirements of Section ~~250-24~~ 250-32.

(b) Disconnecting Means and Overcurrent Protection at Distribution Point. Where the service disconnecting means and overcurrent protection are located at the distribution point, feeders to buildings shall meet the requirements of Section 250-32 and Article 225, Part B.

(c) Disconnecting Means Without Overcurrent Protection at Distribution Point. Where the disconnecting means without overcurrent protection is located at the distribution point and a ~~disconnecting means and overcurrent~~ single-phase 4-wire or three-phase 5-wire service is installed ~~protection is located at the building(s), the grounded circuit conductor connection to the grounding electrode shall not be permitted at the building disconnecting means at each building and~~ all of the following conditions shall be met.

1. All buildings and premises wiring are under single management.

~~2. Disconnecting means suitable for use as service equipment is provided at the distribution point.~~

~~3.~~ 2. An equipment grounding conductor is run with the supply conductors and is of the same size as the largest supply conductor, if of the same material, or is adjusted in size in accordance with the equivalent size columns of Table 250-122 if or different materials.

~~4~~ 3. The equipment grounding conductor is bonded to the grounded circuit conductor at the distribution point or at the source of a separately derived system.

4. The connection of the grounded circuit conductors to the grounding electrode at a separate building(s) or structure(s) shall not be made.

5. A grounding electrode system is provided and connected to the equipment grounding conductor at ~~the~~ each building disconnecting means.

~~Distribution Point. A centrally located electrical supply structure from which services or feeders to agricultural buildings and other buildings, including the associated farm dwelling, are normally supplied.~~

Exception: The farm dwelling shall meet the conditions of 547-8(a) if the existing wiring in the dwelling has the grounded and grounding conductors bonded at the range or clothes dryer outlets.

SUBSTANTIATION: The proposed revisions to 547-8 are made to more clearly present the intent of the changes made to the 1999 NEC. Those who developed analyses of the 1999 NEC all described the requirements in the section differently. The disconnecting means should apply to (a), (b), and (c) not just (a). The term "load end of the service conductors" in part (a) needed clarifying as it was intended to be at the building served. This paragraph should have referenced to 250-32 as there is obviously more than one building served. Listed disconnecting means "suitable for use as service equipment" required in the rules for part (c) are not manufactured. It was not clear what should be the wiring method for service to the dwelling when part (c) was selected. The definition of distribution point could have been interpreted to apply to only (c).
PANEL ACTION: Accept in Principle.
See action on Proposal 19-18a
PANEL STATEMENT: Submitter's concerns regarding distribution point, services, and disconnecting means are covered in Proposal 19-18a and Proposal 19-21.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #3725)

19- 21 - (547-8): Accept in Principle
Note: The Technical Correlating Committee understands that the action on this Proposal further modifies the action on Proposal 19-18a.
SUBMITTER: Barry Bauman, Alliante Energy/Rep. Alliant Energy/Rep. American Society of Agricultural Engineers
RECOMMENDATION: Move "Distribution Point" definition to a point immediately after "547-1" and revise as follows:
547-2 Definition.
Distribution Point. A centrally located electrical supply structure from which service~~s or~~ drops, service laterals, feeders or branch circuits to agricultural buildings and other buildings, including the associated farm dwelling, are normally supplied.
Renumber subsequent sections.
SUBSTANTIATION: The Style Manual calls for definitions that apply to a specific article to be located in the second sentence of that article. The updated language results in a clearer understanding of 547-8.
PANEL ACTION: Accept in Principle.
Revise text to read as follows:
"547-2 Distribution Point
An electrical supply point from which service drops, service laterals, feeders or branch circuits to agricultural buildings, associated farm dwelling(s) and associated buildings under single management are supplied. The Service Point as described in Article 100 is typically at the Distribution Point.
FPN 1. Distribution Points are also known as the Center Yard Pole, Yard Pole, Meter Pole, or the Common Distribution Point."
PANEL STATEMENT: The revisions further clarify the term distribution point.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #3849)

19- 22 - (547-8): Accept in Principle
SUBMITTER: J. Philip Simmons, Simmons Electrical Services
RECOMMENDATION: Make the following changes or additions:
547-8. Service Equipment, ~~Separately Derived Systems,~~ Feeders, Disconnecting Means, and Grounding. Where one or more agricultural or associated farm dwelling buildings are supplied from a distribution point, the disconnection means and grounding of services and feeders shall comply with either (a), or (b). Installations shall also comply with (c), and (d).
(a) Service Disconnecting Means and overcurrent Protection at a Building(s). Where the service disconnecting means and overcurrent protection are located at the load end of the service conductors, service equipment grounding shall meet the requirements of Article 250. ~~Section 250-32. A disconnecting means shall also be installed at the distribution point when two or more buildings are supplied from that distribution point.~~
(b) Service Disconnecting Means and Overcurrent Protection at Distribution Point. Where the service disconnecting means and overcurrent protection are located at the distribution point, feeders to buildings shall meet the requirements of ~~Section 250-32 and~~ Article 225, Part B. An equipment grounding conductor shall be installed from the distribution point to each agricultural building or structure served. The grounding installation shall comply with Section 250-32(b)(1).
~~(c) Disconnecting Means Without Overcurrent Protection at the Distribution Point. Where the disconnecting means without overcurrent protection is located at the distribution point ad a disconnecting means and overcurrent protection is located at the building(s), the grounded circuit conductor connection to the grounding electrode shall not be permitted at the building disconnecting means at each building and all of the following conditions shall be met.~~
~~1. All buildings and premises wiring are under single management.~~
~~2. Disconnection means suitable for use as service equipment is provided at the distribution point.~~
~~3. An equipment grounding conductor is run with the supply conductors and is of the same size as the largest supply conductor, if of the same material, or is adjusted in size in accordance with the equivalent size columns of Table 250-122 if of different materials.~~
~~4. The equipment grounding conductor is bonded to the grounded circuit conductor at the distribution point or at the source of a separately derived system.~~
~~5. A grounding electrode system is provided and connected to the equipment grounding conductor at the building disconnecting means.~~
(c) Supplying Loads. To the extent practicable, equipment in agricultural buildings shall be supplied line-to-line.
(d) Underground Equipment Grounding Conductors. Where livestock is housed, any portion of the equipment grounding conductor run underground to the building or structure disconnecting means shall be insulated or covered copper.
Distribution Point. A centrally located electrical supply structure from which services or feeders to agricultural buildings and other buildings, including the associated farm dwelling, are normally supplied.
SUBSTANTIATION: The words "Separately Derived System" in the section title should be deleted as this section makes no reference to them.
The words "or associated farm dwelling" are being added to the opening paragraph as some buildings such as dwellings are supplied from the distribution point. These "associated" buildings should be permitted to comply with the ordinary rules for disconnecting means and grounding requirements independent of their association with wiring for agricultural buildings.
Proposed changes to (a) and (b) and deletion of (c). Several years ago, a joint task group of CMP-5 and 19 met to discuss the grounding requirements of agricultural buildings. As I recall the conclusions reached, the task group recommended that the grounded circuit conductor (often a neutral) not be grounded again at the agricultural where it was grounded at the service. Doing so addresses the tingle voltage situation. Changes proposed to these subsections will permit the service to be grounded at the individual building but will not allow the feeder grounded conductor to be grounded at the individual buildings where the service is installed at the distribution point.
(a) There is no justification for requiring that service disconnecting means be provided at the distribution point where the service conductors extend to the building or structure. In this case, perhaps metering only is installed at the distribution point.
(b) Where the service disconnecting means and system are grounded at the distribution point, the conductors to the buildings are feeders. As such, the feeder should contain an equipment grounding conductor and be grounded in accordance with Section 250-32(b). This will help reduce the tingle voltage problem.
(c) The introduction of a service disconnecting means without overcurrent protection either inside the service disconnecting means or immediately adjacent thereto in the 1999 NEC was done so without proper substantiation or coordination with Section 230-91. In addition, the definition of "Service Conductors" in Article 100 makes it clear that the service conductors end at the service disconnecting means. That means the conductors on the load side of the service disconnecting means are feeder conductors. Overcurrent protection of feeders is required to comply with Section 240-3.
New (c) Connecting loads in a line-to-line manner should reduce voltage drop in the neutral agricultural buildings, it should be located in Article 547 to assist the user of the NEC.

New (d) This requirement presently exists in Section 250-32(e). Since it relates only to agricultural buildings, it should be located in Article 547 to assist the user of the NEC.
PANEL ACTION: Accept in Principle.
See action on Proposal 19-18a and 19-21.
PANEL STATEMENT: Submitter's concerns regarding distribution point, services, underground copper grounding conductors, and disconnecting means are covered in Proposal 19-18a and Proposal 19-21.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #4086)

19- 23 - (547-8): Accept in Principle
SUBMITTER: Truman C. Surbrook, Michigan State University
RECOMMENDATION: Revise text to read as follows:
547-8. Electrical Supply to Buildings or Structures from a Distribution Point. Where one or more ~~agricultural~~ buildings or structures are supplied from a distribution point, the conductors supplying the buildings or structures ~~disconnecting means and grounding of services and feeders~~ shall comply with (a) or (b).
(a) Disconnecting Means and Overcurrent Protection Located at the Building(s) or Structure(s). Where the disconnecting means and overcurrent protection are located at the building(s) or structure(s) supplied by the conductors, a disconnecting means suitable for use as service equipment and grounded in accordance with the requirements of Section 250-24 is installed at the distribution point, the conductors are sized in accordance with Article 225, installed in accordance with the requirements of Parts B and C of Article 220, and the conditions in either (1) or (2) are met:
(1) The grounded conductor shall serve as the equipment grounding conductor for the building(s) or structure(s) and the service equipment at the building(s) or structure(s) shall be grounded in accordance with the requirements Section 250-24.
(2) A separate equipment grounding conductor is run with the supply conductors to the building(s) or structure(s).
a. all building(s) and structure(s) supplied from the distribution point are under single management.
b. The equipment grounding conductor is of the same size as the largest supply conductor, if of the same material, or is adjusted in size in accordance with the equivalent size columns of Table 250-122 of different materials.
c. The equipment grounding conductor is bonded to the grounded circuit conductor at the disconnecting means enclosure at the distribution point or at the source of a separately derived system.
d. A grounding electrode system is provided in accordance with part C of Article 250 and connected to the equipment grounding conductor at the building(s) or structure(s) disconnecting means.
(b) Disconnecting Means and Overcurrent Protection at Distribution Point. Where the disconnecting means and overcurrent protection for each set of feeder conductors is located at the distribution point, feeders to building(s) or structure(s) shall meet the requirements of Section 250-32 and Article 225, Part B.
(c) Distribution Point. An ~~centrally located~~ electrical supply point ~~structure~~ from which services, laterals, or feeders to agricultural building(s) or structure(s) and other buildings, including the associated farm dwelling, are normally supplied.
SUBSTANTIATION: The section as written in the 1999 NEC is difficult to read and understand. The suggested change arranges the requirements in an order that is easier to understand. Some new language was added and is underlined. Some of the sections were reworded, but not underlined but are believed to be of the same intent. There is no actual change of intent in the proposal, but some new references were added to make the meaning clear. The definition of distribution point was altered because it may not necessarily be a pole and it may not be centrally located.
PANEL ACTION: Accept in Principle.
See Proposals 19-18a and 19-21.
PANEL STATEMENT: Submitter's concerns regarding distribution point, services, and disconnecting means are covered in Proposal 19-18a and Pproposal 19-21.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #4247)

19- 24 - (547-8): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Identify the definition of "distribution point" as (d) and revise (c) to read as follows:
(c) Disconnecting Means Without Overcurrent Protection at the Distribution Point. Where a service disconnecting means is located at the distribution point, overcurrent protection shall be permitted to be omitted for the feeder(s) originating at that point provided all the following conditions are met:
(1) Single Management. All buildings and premises wiring shall be under single management.
(2) Disconnecting Means. The disconnecting means at the distribution point shall simultaneously disconnect all ungrounded conductors it controls, and it shall be approved as suitable to disconnect the load served at the system voltage. It shall be permitted to be accessible by portable means. Where it is not readily accessible, it shall be capable of operation from a readily accessible point.
(3) Wiring Methods. The feeder conductors shall be wired as service conductors in accordance with the applicable requirements of Parts A, B, C, and D of Article 230.
(4) Building Disconnects and Overcurrent Protection. The feeder(s) running to each building served shall terminate in one or more building disconnecting means meeting the requirements of Part B of Article 225. The feeder(s) shall have overload protection sized and located in accordance with the requirements in Section 230-90 and 230-91 for service conductors.
(5) System Grounding. The grounded conductor of the system shall be grounded at the distribution point. It shall be connected to a grounding electrode through a grounding electrode conductor in accordance with the requirements of Part C of Article 250. The grounded circuit conductor shall not be connected to a grounding electrode or to any equipment grounding conductor on the load side of the distribution point.
(6) Equipment Grounding. An equipment grounding conductor shall be run with each feeder. It shall be of the same size as the largest feeder conductor, if of the same material, or adjusted in size in accordance with the equivalent size columns of Table 250-122 if of different materials. The equipment grounding conductors shall be bonded to the grounded circuit conductor at the distribution point, or at the source of a separately derived system.
(7) Building Electrodes. A grounding electrode system meeting the requirements of Part C of Article 250 shall be provided at each building. It shall be connected to the equipment grounding conductor running with the feeder conductors to the building.
Exception to (5), (6), and (7) above: The grounded circuit conductor shall be permitted to be connected to the building disconnecting means and to the grounding electrode system of that building where all the requirements of Section 250-32(b)(2) are met.
SUBSTANTIATION: These systems use utility-style pole-top switches that aren't being listed as suitable for service equipment and that are unlikely to be so listed in the immediate future. Nevertheless the 1999 NEC has changed "service disconnecting means" to "disconnecting means suitable for use as service equipment." This proposal allows jurisdictional approval instead as a transition period until listed equipment becomes generally available. In addition, the 1999 NEC rewrite fails to adequately address the fact that this provision is intended to amend Section 230-91(a). This provision is unique in the NEC, and recognizes feeders that have no overcurrent protection. This needs to be carefully clarified. This proposal preserves the intent of the 1999 NEC rewrite, while providing clear editorial guidance as to what the system is supposed to be and how it is to be connected. In addition, the NEC fails to provide language that recognizes that these feeder conductors are equivalent to service conductors in hazard, since they are unprotected; this proposal addresses that issue.
This proposal also changes the 1999 NEC provision, far-reaching and unsubstantiated, that will now require that if one agricultural building makes use of this wiring procedure, then all fed from the same distribution point must do so, including the farmhouse. In discussions with some panel members, it appears that this was inadvertent and unintended. If enforced as written, it would probably change the wiring procedure for the power supply to almost any farmhouse from the present three-wire custom.
Separating the distribution point definition out as its own subsection is an editorial change to clarify that it is not part of Section 547-8(c). The intent is that it apply to the entire section.
PANEL ACTION: Accept in Principle.
See Proposals 19-18a and 19-21.

PANEL STATEMENT: Submitter's concerns regarding services and disconnecting means are covered in Proposal 19-18a and Proposal 19-21.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #936)

19- 25 - (547-8, Distribution Point): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Service~~s equipment,~~ Separately Derived Systems, Feeders, Branch Circuits, Disconnecting Means, and Grounding. Where one or more agricultural buildings are supplied from a distribution point, the disconnecting means and grounding of services and feeders shall comply with (a), (b), or (c).
(a) Disconnecting Means and Overcurrent Device(s) at a Building(s). Where the ~~disconnecting means and overcurrent protection are~~ service equipment is located at the building served ~~load end of the service conductors,~~ service ~~equipment~~ grounding shall meet the requirements of Section 250-24. Where the disconnecting means for feeder or branch circuit supply conductors is located at the building served grounding shall meet the requirements of Section 250-32. A disconnecting means for each circuit shall also be installed at the distribution point where two or more buildings are supplied from that distribution point.
(b) Disconnecting Means and Overcurrent Protection at Distribution Point. Where the disconnecting means ~~and overcurrent protection~~ for a feeder(s) or a branch circuit(s) is ~~are~~ located at the distribution point the feeder(s) and branch circuit(s) to buildings shall meet the requirements of Section 250-32 and Article 225, Part B.
(c) No change.
(d) Definition. Distribution Point. For the purposes of this section ~~A.~~ a distribution point is a centrifically located electrical supply structure from which service~~s, or~~ feeder~~s~~, or branch circuit conductors to agricultural buildings covered in this article ~~and other buildings, including the associated farm dwelling,~~ are normally supplied, and that may also supply other buildings, including the associated farm dwelling.
SUBSTANTIATION: Editorial. Branch circuits should be noted as they may supply buildings.
"Service equipment" in (a) is disconnecting means and overcurrent devices and is always at the load end of service conductors since conductors "downstream" from this point are not service conductors. Overcurrent protection at the load end is overload protection. All portions of a service should comply with Section 250-24, not just service equipment, and grounding requirements for feeders and branch circuits should be included. A disconnecting means is specified for each circuit (at the distribution point) since if only one building is supplied by two or more circuits as permitted by Sections 230-2(a) and 225-30(a) no disconnect is required, but if one feeder supplies more than one building a disconnect is required.
In (b) the disconnecting means is clarified as applying to a feeder or branch circuit and omits the overcurrent protection reference since the overcurrent protection is normally at the point of supply, except under some tap rules.
The "definition" of distribution point is revised to include branch circuits and specifically limit it to agricultural buildings covered in this article.
PANEL ACTION: Accept in Principle.
See Proposals 19-18a and 19-21.
PANEL STATEMENT: Submitter's concerns regarding distribution point, services, and disconnecting means are covered in Proposal 19-18a and Proposal 19-21.

SUBMITTER: CMP 19
RECOMMENDATION: Revise text to read:
547-9 Equipotential Planes and Bonding of Equipotential Planes.
(A) Buildings Requiring Equipotential Planes. Equipotential planes shall be installed in concrete floors of livestock confinement buildings that contain metal equipment accessible to livestock that is likely to become energized.
(B) Areas Requiring Equipotential Planes. Outdoor dirt and concrete surface confinement areas such as feedlots, and indoor or outdoor dirt surface areas such as horse stalls and feedlots shall have equipotential planes installed around metallic equipment that is accessible to animals and likely to become energized. The equipotential plane shall encompass the area around the equipment were the animal will stand while accessing the equipment.
(C) Bonding. Equipotential planes shall be bonded to the building or structure electrical grounding system. The bonding conductor shall be copper, insulated, covered or bare, and not smaller than 8 AWG. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means.
Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.
FPN No. 1: Methods to establish equipotential planes are described in Equipotential Planes in Animal Containment Areas, American Society of Agricultural Engineers (ASAE) EP473-1997.
FPN No. 2: Low grounding electrode system resistances may reduce potential differences in livestock facilities.
SUBSTANTIATION: This Code Panel proposal is a combination of existing requirements and proposals 19-27, 19-30, and 19-31. The requirements for equipotential planes has been reorganized to remove exceptions and clarify the area where equipotential planes are necessary. Bonding requirements for equipotential planes were moved to an identified section. The conditional language for voltage gradients was completely removed. See supporting data submitted for proposal 19-31.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 8
COMMENT ON AFFIRMATIVE:
MCCULLOUGH: Add the following sentence directly under the title and before (A):
For the purposes of this section, the term livestock does not include poultry.
This is language from the definition of an equipotential plane what was added for the 1999 cycle to indicate that the requirements for an equipotential plane were not applicable to poultry areas. The Panel Action on Proposal 19-28 moved the definition to 547-2 and modified the language to state "for the purposes of this article livestock does not include poultry." I believe that we did not intend to exempt poultry areas from the requirements of this entire article. Refer to 547-1(A) and (B)(1), poultry areas are part of the scope of this article. See also my comment on Proposal 19-28.

(Log #4248)

19- 27 - (547-9): Accept in Principle in Part

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

RECOMMENDATION: Revise as follows:

547-9. Bonding and Equipotential Plane.

(a) Definition of Equipotential Plane. An area accessible to livestock where a wire mesh or other conductive elements are embedded in concrete, are bonded to all metal structures and fixed nonelectrical metal equipment that may become energized and are connected to the electrical grounding system to prevent a difference in voltage from developing within the plane. For this section, livestock does not include poultry.

(b) General. Wire mesh or other conductive elements shall be installed in the concrete floor of livestock confinement areas and be bonded to the building grounding electrode system to provide an equipotential plane. ~~that may have voltage gradient ramps at entrances and exits that are traversed daily by the same livestock~~. The bonding conductor shall be copper, insulated, covered or bare, and not smaller than No. 8. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means.

Exception No. 1: An equipotential plane shall not be required where there is no electric service to the building nor metal equipment accessible to livestock that is likely to become energized.

Exception No. 2: Slatted floors that are supported by structures that are a part of an equipotential plane shall not be required to be bonded.

(c) Voltage Gradient Ramps. Where voltage gradients at entrances and exits that are traversed daily by the same livestock exceed 1 volt per foot at the edge of an equipotential plane, a voltage gradient ramp shall be installed.

FPN No. 1: A natural voltage gradient exists at the edge of an equipotential plane. ~~Typically, voltage gradients exceeding 1 volt per foot at the edge of the equipotential plane will require a voltage gradient ramp.~~

FPN No. 2: Methods to establish equipotential planes and voltage gradient ramps are described in Equipotential Planes in Animal Containment Areas, American Society of Agricultural Engineers (ASAE) EP473-1997.

FPN No. 3: Low grounding electrode system resistances may reduce potential differences in livestock facilities.

(d) Receptacles. All 125-volt, single-phase, 15- and 20- ampere general purpose receptacles in areas having an equipotential plane shall have ground-fault circuit-interrupter protection for personnel.

SUBSTANTIATION: This proposal addresses major style manual violations in the 1999 NEC. This part of the Code has a "rule" in code language that uses the word "may" and not in its accepted usage of a discretionary finding on the part of an AHJ. Then a fine print note following uses mandatory language ("require") which also isn't permitted. When we put the FPN with mandatory language together with the rule with permissive language, I suppose we are left with what might be a requirement.

The proposal addresses these style issues. The submitter makes no claim as to technical authority over the substance of these rules, but the panel may find this format constructive in terms of proper editorial formatting as it continues to wrestle with the technical questions. If there is to be an enforceable requirement for voltage gradient ramps, this editorial structure will accomplish that goal.

PANEL ACTION: Accept in Principle in Part.

The panel accepts the deletion of (b) of the recommendation. The added text in (c) is rejected by the panel. The entire FPN 1 is deleted.

PANEL STATEMENT: See panel action in Proposal 19-26a. This panel action covers parts of the recommendation not accepted by the panel.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

(Log #3724)

19- 28 - (547-9(a)): Accept

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

SUBMITTER: Barry Bauman, Alliante Energy/Rep. Alliant Energy/Rep. American Society of Agricultural Engineers

RECOMMENDATION: Move "547-9(a)" to a point immediately after "547-1" and revise as follows:

547-2 Definition.

~~(a) Definition of~~ Equipotential Plane. An area accessible to livestock where a wire mesh or other conductive elements are embedded in concrete, are bonded to all metal structures and fixed nonelectrical metal equipment that may become energized and are connected to the electrical grounding system to prevent a difference in voltage from developing within the plane. For this ~~section~~ article, livestock does not include poultry.

Renumber subsequent sections.

SUBSTANTIATION: The Style Manual calls for definition that apply to a specific article to be located in the second section of that article. The updated language results in a clearer understanding of 547-8.

PANEL ACTION: Accept.

PANEL STATEMENT: There will be editorial changes in the recommendation made to conform to the requirements of the style manual.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

VOTE ON PANEL ACTION:

AFFIRMATIVE: 7

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

BAUMAN: The last sentence "For this section, livestock does not include poultry." should not be moved to the definitions section. It should remain in 547-8. All sections of 547 except 547-8 pertain to buildings containing poultry. Moving this sentence to the definitions section even though it is the Equipotential Plane Definition may be interpreted to be in conflict with the scope of 547.

COMMENT ON AFFIRMATIVE:

MCCULLOUGH: Panel Action should be changed to Accept in Principle and in addition to the editorial revisions in the first sentence, the last sentence dealing with poultry should be deleted. This sentence would then be added to 547-9. See also my comment on Proposal 19-26a.

(Log #1088)

19- 29 - (547-9(b)): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Change "No. 8" to "8 AWG".

SUBSTANTIATION: To provide consistency throughout the Code The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

PANEL STATEMENT: The NEC Style of Manual does not specify the language used one way or another. The NFPA Manual of Style seems to prefer 10 AWG. Product standards use 10 AWG or 10 AWG 110-6 says that the conductor sizes are expressed in AWG or in circular mils so the AWG is implied The panel recognizes that the TCC may desire to take a different action to be consistent with the Code.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

(Log #3720)

19- 30 - (547-9(b)): Accept in Principle

SUBMITTER: Barry Bauman, Alliante Energy/Rep. Alliant Energy/Rep. American Society of Agricultural Engineers

RECOMMENDATION: Revise text to read as follows:

(b) General. Wire mesh or other conductive elements shall be installed in the concrete floor of livestock confinement areas and be bonded to the building grounding electrode system to provide an equipotential plane ~~that may have voltage gradient ramps as entrances and exists that are traversed daily by the same livestock~~. The bonding conductor shall be copper, insulated, covered or bare, and not smaller than No. 8. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. In dirt confinement areas such as feedlots and horse stalls, equipotential planes shall only be required around electrical equipment that is accessible to animals, such as electrically heated waterers, or metal equipment that is likely to become energized.

Exception No. 1: An equipotential plane shall not be required where ~~there is no electric service to the building nor~~ metal

equipment accessible to livestock ~~that~~ is not likely to become energized.

Exception No. 2: Slatted floors that are supported by structures that are a part of an equipotential plane shall not ~~be required to be bonded.~~ require bonding.

FPN No. 1: Methods to establish equipotential planes and voltage gradient ramps are described in Equipotential Planes in Animal Containment Areas, American Society of Agricultural Engineers (ASAE) ~~FPN No. 1:~~ EP473-1997. A natural voltage gradient exists at the edge of an equipotential plane. ~~Typically, voltage gradients exceeding 1 volt per foot at the edge of the equipotential plane will require a voltage gradient ramp. FPN No. 2: Methods to establish equipotential planes and voltage gradient ramps are described in Equipotential Planes in Animal Containment Areas, American Society of Agricultural Engineers (ASAE) EP473-1997.~~

FPN No. ~~3.~~ 2: Low grounding electrode system resistance's may reduce potential differences in livestock facilities.

SUBSTANTIATION: Cattle feeders have asked for guidance if dirt feedlots with concrete at the feed bunks require equipotential planes. The change to only require equipotential planes in the areas containing electrical equipment is proposed to clarify the intent for such applications.

Exception No. 1 is modified to clarify the intent as in the present text, "nor" could mean both conditions are required.

Change FPN No. 2 to FPN No. 1 and add the cautionary note about the possible need for gradient ramps.

Change FPN No. 3 to FPN No. 1.

FPN No. 1 is deleted because it contains mandatory language and it coincides with the change in the proposed text.

PANEL ACTION: Accept in Principle.

See Proposal 19-26a. This action addresses this recommendation.

PANEL STATEMENT: See Proposal 19-26a. The requirements for equipotential planes has been reorganized to remove exceptions and clarify the area where equipotential planes are necessary. Bonding requirements for equipotential planes were moved to an identified section. The conditional language for voltage gradients was completely removed. See supporting data submitted for Proposal 19-31.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

(Log #4124)

19- 31 - (547-9(b)): Accept in Principle

SUBMITTER: Robert Fick, Michigan State University

RECOMMENDATION: Rewrite (b) of the section and separate the requirements for an equipotential plane and gradient transition from the methods of installation. Put the requirements or an equipotential plane in 547-9(b) and the requirements for a gradient transition in 547-9(c). Renumber the present 547-9(c) as paragraph (d). The exceptions are incorporated into the new sections. Fine print note No. 1: is incorporated into the new sections. Add new material underlined that addresses shortcomings in the present working so the sections will read as follows:

547-9. Equipotential Planes and Transitions.

(a) [no change in definition]

(b) Wire mesh or other conductive elements shall be installed in the concrete floor of livestock confinement areas where:

(1) the building or area is served with electric power and there is metal equipment accessible to livestock that is likely to become energized.

(2) the floor is not constructed of slats that are supported by a structure that is a part of an equipotential plane.

(c) A voltage gradient transition shall be installed where livestock traverse daily:

(1) the edge of concrete floors.

(2) entrances to buildings.

(3) areas where the exposure to the metal gradient elements does not create a hazard greater than the low level voltage such as with a concrete aisle and earth floor stalls.

(d) [former (c) with no changes]

547-10. Equipotential Plane Bonding and Transitions.

(a) Equipotential Plane Bonding. The equipotential plane shall be bonded to the building grounding electrode system with a copper conductor, insulated, covered or bare, and not smaller than No. 8. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. The bonding conductor shall be protected by suitable raceway as it emerges from the concrete.

(b) Transition Installation. The equipotential plane transition shall be provided by one of the following means when the gradient is more than one volt per linear foot measured at the edge of the equipotential plane: (1) sloping the wire mesh or other conductive element to a greater depth at the edge of the concrete so the mesh or metal element is not less than 12 in. below grade, (2) driving ground rods into the earth at an angle of no more than 45 degrees from the horizontal and spaced not more than 18 in. center to center, or (3) by some other effective means. The voltage gradient may be determined by measuring under expected loading conditions.

SUBSTANTIATION: The section is rewritten to eliminate the exceptions and include all rules in one comprehensive statement. The rules for installation of gradient ramps was not specific and left to wide interpretation by persons with little experience in such matters. The changes are the result of dealing with equipotential plane issues in several states and based upon research conducted at Michigan State University on equipotential planes and transitions.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle.

See Panel action on Proposal 19-26a. This action addresses the principle of this recommendation.

PANEL STATEMENT: See Panel statement on Proposal 19-26a. The requirements for equipotential planes has been reorganized to remove exceptions and clarify the area where equipotential planes are necessary. Bonding requirements for equipotential planes were moved to an identified section. The conditional language for voltage gradients was completely removed. See supporting data submitted for Proposal 19-31.

(Log #2450)

19- 32 - (547-9(c)): Reject

SUBMITTER: John A. Hoffman, Centre Region Code Admin.

RECOMMENDATION: Revise as follows:

(c) Receptacles. All receptacles in areas where livestock is confined shall have ground fault circuit interrupter protection for personnel.

SUBSTANTIATION: This change affects installation of receptacles in areas of agricultural buildings which are typically wet locations. The risk of shock or electrocution exists without regard to the equipotential plane. The proposal provides an equal degree of safety to that required by 305-6(a) and 305-6(b).

PANEL ACTION: Reject.

PANEL STATEMENT: See Panel action on Proposal 19-34. GFCI protection for all receptacles is not the intent of the Code.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

(Log #3053)

19- 33 - (547-9(c)): Reject

SUBMITTER: Dwayne A. Gunnels, Clio, MI

RECOMMENDATION: Delete this paragraph.

SUBSTANTIATION: In agricultural buildings most times, especially around livestock, there are increased amounts of moisture that would cause nuisance tripping which could lead to tampering with the receptacle causing an unsafe condition.

PANEL ACTION: Reject.

PANEL STATEMENT: GFCI is required only on general purpose outlets, not on dedicated use outlets where nuisance tripping would cause a problem.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

VOTE ON PANEL ACTION:

Log #3721)

19- 34 - (547-9(c)): Accept in Principle

Note: The Technical Correlating Committee understands that the action on this Proposal modifies the action on Proposal 19-26a.

SUBMITTER: Barry Bauman, Alliante Energy/Rep. Alliant Energy/Rep. American Society of Agricultural Engineers

RECOMMENDATION: Move 547-9(c) to 547-4(g) and revise as follows:

(~~c~~ g) Receptacles. All 125-volt, single-phase, 15- and 20-ampere general purpose receptacles installed in the locations specified belo

~~in areas having an equipotential plane~~ shall have ground-fault circuit-interrupter protection for personnel.
(1) In areas having an equipotential plane.
(2) Outdoors.
(3) Wet areas.
SUBSTANTIATION: This will provide the same level of personnel protection outdoors and in wet areas of the farmstead that is now required in equipotential planes and in the farm dwelling.
PANEL ACTION: Accept in Principle.
Change "wet areas" to "wet locations" under (3).
PANEL STATEMENT: The change would keep Code terminology consistent.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #4125)

19- 35 - (547-9(c)): Accept in Principle
SUBMITTER: Robert Fick, Michigan State University
RECOMMENDATION: Move 547-9(c) to 547-11.
SUBSTANTIATION: The requirement is located in the wrong place and not easily found. It needs its own identify. See my other proposal dealing with 547-9(c).
PANEL ACTION: Accept in Principle.
See panel action on Proposal 19-34. This action addresses the principle of this recommendation.
PANEL STATEMENT: Text was moved to the appropriate location.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

(Log #4126)

19- 36 - (547-9(c)): Reject
SUBMITTER: Jonathan R. Althouse, Michigan State University
RECOMMENDATION: Delete the entire paragraph.
SUBSTANTIATION: With the special grounding conductors of a copper equipment grounding conductor in 547-4(f) safety of equipment at receptacles is covered. No accident statistics were presented when the section was first introduced that justified steps beyond the copper equipment grounding conductor required. The high humidity conditions in many agricultural areas result in nuisance tripping to the point that circuits are being tampered to keep them working. This introduces an even greater safety hazard. If grounding is proper, the requirement is not needed.
PANEL ACTION: Reject.
PANEL STATEMENT: GFCI is required only on general purpose outlets, not on dedicated use outlets where nuisance tripping would cause a problem.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8
VOTE ON PANEL ACTION:
AFFIRMATIVE: 8

ARTICLE 550 — MOBILE HOMES, MANUFACTURED HOMES, AND MOBILE HOME PARKS

(Log #441)

19- 37 - (550): Accept in Principle
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. The Technical Correlating Committee directs that the Panel clarify the Panel action on this Proposal as expressed in the Affirmative Comment and to clarify in 550-13(d)(9) if the inclusion of the word "or" between "lighting" and "fixture" in the third sentence was the Panel's intent. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Revise Article 550 to read as follows:
ARTICLE 550 -- Mobile Homes, Manufactured Homes, and Mobile Home Parks
I General
550.1 Scope. The provisions of this article cover the electrical conductors and equipment installed within or on mobile and manufactured homes, the conductors that connect mobile and manufactured homes to a supply of electricity, and the installation of electrical wiring, fixtures, equipment, and appurtenances related to electrical installations within a mobile home park up to the mobile home service-entrance conductors or, if none, the mobile home service equipment.
FPN: For additional information on manufactured housing see *Standard for Manufactured Housing*, NFPA 501-2000 and Part 3280, Manufactured Home Construction and Safety Standards of the federal Department of Housing and Urban Development.
550.2 Definitions.
Appliance, Fixed. An appliance that is fastened or otherwise secured at a specific location.
Appliance, Portable. An appliance that is actually moved or can easily be moved from one place to another in normal use.
FPN: For the purpose of this article, the following major appliances, other than built-in, are considered portable if cord connected: refrigerators, range equipment, clothes washers, dishwashers without booster heaters, or other similar appliances.
Appliance, Stationary. An appliance that is not easily moved from one place to another in normal use.
Distribution Panelboard. See definition of panelboard in Article 100.
Feeder Assembly. The overhead or under-chassis feeder conductors, including the grounding conductor, together with the necessary fittings and equipment or a power-supply cord listed for mobile home use, designed for the purpose of delivering energy from the source of electrical supply to the distribution panelboard within the mobile home.
Laundry Area. An area containing or designed to contain a laundry tray, clothes washer, or a clothes dryer.
Manufactured Home. A factory-assembled structure or structures that bears a label identifying it as a manufactured home that is transportable in one or more sections, that is built on a permanent chassis and designed to be used as a dwelling with or without a permanent foundation where connected to the required utilities, and that includes the plumbing, heating, air-conditioning, and electrical systems contained therein.
For the purpose of this Code and unless otherwise indicated, the term mobile home includes manufactured homes.
FPN No. 1: See the applicable building code for definition of the term permanent foundation.
FPN No. 2: See Part 3280, Manufactured Home Construction and Safety Standards, of the federal Department of Housing and Urban Development for additional information on the definition.
Mobile Home. A factory-assembled structure or structures transportable in one or more sections that is built on a permanent chassis and designed to be used as a dwelling without a permanent foundation where connected to the required utilities, and includes the plumbing, heating, air-conditioning, and electric systems contained therein.
For the purpose of this Code and unless otherwise indicated, the term mobile home includes manufactured homes.
Mobile Home Accessory Building or Structure. Any awning, cabana, ramada, storage cabinet, carport, fence, windbreak, or porch established for the use of the occupant of the mobile home on a mobile home lot.
Mobile Home Lot. A designated portion of a mobile home park designed for the accommodation of one mobile home and its accessory buildings or structures for the exclusive use of its occupants.
Mobile Home Park. A contiguous parcel of land that is used for the accommodation of occupied mobile homes.
Mobile Home Service Equipment. The equipment containing the disconnecting means, overcurrent protective devices, and receptacles or other means for connecting a mobile home feeder assembly.
Park Electrical Wiring Systems. All of the electrical wiring, fixtures, equipment, and appurtenances related to electrical installations within a mobile home park, including the mobile home service equipment.
550.3 Other Articles. Wherever the requirements of other articles of this Code and Article 550 differ, the requirements of Article 550 shall apply.
550.4 General Requirements.
(A) Mobile Home Not Intended as a Dwelling Unit. A mobile home not intended as a dwelling unit, for example, those equipped for sleeping purposes only, contractor's on-site offices, construction job dormitories, mobile studio dressing rooms, banks, clinics, mobile stores, or intended for the display or demonstration of merchandise or machinery, shall not be required to meet the provisions of this article pertaining to the number or capacity of circuits required. It shall, however, meet all other applicable requirements of this article if provided with an electrical installation intended to be energized from a 120-volt or 120/240-volt ac power supply system. Where different voltage is required by either design or available power supply system, adjustment shall be

made in accordance with other articles and sections for the voltage used.

(B) In Other than Mobile Home Parks. Mobile homes installed in other than mobile home parks shall comply with the provisions of this article.

(C) Connection to Wiring System. The provisions of this article apply to mobile homes intended for connection to a wiring system rated 120/240 volts, nominal, 3-wire ac, with grounded neutral.

(D) Listed or Labeled. All electrical materials, devices, appliances, fittings, and other equipment shall be listed or labeled by a qualified testing agency and shall be connected in an approved manner when installed.

II Mobile and Manufactured Homes

550.~~5~~ 10 Power Supply.

(A) Feeder. The power supply to the mobile home shall be a feeder assembly consisting of not more than one listed 50-ampere mobile home power-supply cord with an integrally molded or securely attached plug cap, or a permanently installed feeder.

Exception No. 1: A mobile home that is factory equipped with gas or oil fired central heating equipment and cooking appliances shall be permitted to be provided with a listed mobile home power-supply cord rated 40 amperes.

Exception No. 2: Manufactured homes constructed in accordance with Section 550.~~23~~32(B).

(B) Power-Supply Cord. If the mobile home has a power-supply cord, it shall be permanently attached to the distribution panelboard or to a junction box permanently connected to the distribution panelboard, with the free end terminating in an attachment plug cap.

Cords with adapters and pigtail ends, extension cords, and similar items shall not be attached to, or shipped with, a mobile home.

A suitable clamp or the equivalent shall be provided at the distribution panelboard knockout to afford strain relief for the cord to prevent strain from being transmitted to the terminals when the power-supply cord is handled in its intended manner.

The cord shall be a listed type with four conductors, one of which shall be identified by a continuous green color or a continuous green color with one or more yellow stripes for use as the grounding conductor.

(C) Attachment Plug Cap. The attachment plug cap shall be a 3-pole, 4-wire, grounding type, rated 50 amperes, 125/250 volts with a configuration as shown in Figure 550.~~5~~ 10(c) and intended for use with the 50-ampere, 125/250-volt receptacle configuration shown in Figure 550.~~5~~ 10(c). It shall be listed, by itself or as part of a power-supply cord assembly, for the purpose, and shall be molded to or installed on the flexible cord so that it is secured tightly to the cord at the point where the cord enters the attachment plug cap. If a right-angle cap is used, the configuration shall be oriented so that the grounding member is farthest from the cord.

FPN: Complete details of the 50-ampere plug and receptacle configuration can be found in the National Electrical Manufacturers Association Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA WD6-1989, Figure 14-50.

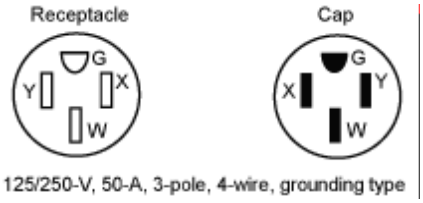

Figure 550.~~5~~ 10(c) 50-ampere, 125/250-volt receptacle and attachment plug cap configurations, 3-pole, 4-wire, grounding-types, used for mobile home supply cords and mobile home parks.

(D) Overall Length of a Power-Supply Cord. The overall length of a power-supply cord, measured from the end of the cord, including bared leads, to the face of the attachment plug cap shall not be less than 21 ft (6.4 m) and shall not exceed 36 1/2 ft (11.13 m). The length of the cord from the face of the attachment plug cap to the point where the cord enters the mobile home shall not be less than 20 ft (6.1 m).

(E) Marking. The power-supply cord shall bear the following marking:

FOR USE WITH MOBILE HOMES — 40 AMPERES.

or

FOR USE WITH MOBILE HOMES — 50 AMPERES.

(F) Point of Entrance. The point of entrance of the feeder assembly to the mobile home shall be in the exterior wall, floor, or roof.

(G) Protected. Where the cord passes through walls or floors, it shall be protected by means of conduits and bushings or equivalent. The cord shall be permitted to be installed within the mobile home walls, provided a continuous raceway having a maximum size of 1 1/4 in. (31.8 mm) is installed from the branch-circuit panelboard to the underside of the mobile home floor.

(H) Protection Against Corrosion and Mechanical Damage. Permanent provisions shall be made for the protection of the attachment plug cap of the power-supply cord and any connector cord assembly or receptacle against corrosion and mechanical damage if such devices are in an exterior location while the mobile home is in transit.

(I) Mast Weatherhead or Raceway. Where the calculated load exceeds 50 amperes or where a permanent feeder is used, the supply shall be by means of the following:

(1) One mast weatherhead installation, installed in accordance with Article 230, containing four continuous, insulated, color-coded feeder conductors, one of which shall be an equipment grounding conductor; or

(2) A metal raceway or rigid nonmetallic conduit from the disconnecting means in the mobile home to the underside of the mobile home, with provisions for the attachment to a suitable junction box or fitting to the raceway on the underside of the mobile home [with or without conductors as in Section 550.~~5~~ 10(I)(1)]. The manufacturer shall provide written installation instructions stating the proper feeder conductor sizes for the raceway and the size of the junction box to be used.

550.~~6~~ 11 Disconnecting Means and Branch-Circuit Protective Equipment.

The branch-circuit equipment shall be permitted to be combined with the disconnecting means as a single assembly. Such a combination shall be permitted to be designated as a distribution panelboard. If a fused distribution panelboard is used, the maximum fuse size for the mains shall be plainly marked with lettering at least 1/4 in. (6.4 mm) high and visible when fuses are changed.

Where plug fuses and fuseholders are used, they shall be tamper-resistant Type S, enclosed in dead-front fuse panelboards. Electrical distribution panelboards containing circuit breakers shall also be dead-front type.

FPN: See ~~Section~~ 110.22 concerning identification of each disconnecting means and each service, feeder, or branch circuit at the point where it originated and the type marking needed.

(A) Disconnecting Means. A single disconnecting means shall be provided in each mobile home consisting of a circuit breaker, or a switch and fuses and its accessories installed in a readily accessible location near the point of entrance of the supply cord or conductors into the mobile home. The main circuit breakers or fuses shall be plainly marked "Main." This equipment shall contain a solderless type of grounding connector or bar for the purposes of grounding, with sufficient terminals for all grounding conductors. The neutral bar termination of the grounded circuit conductors shall be insulated in accordance with Section 550.~~11~~ 16(A). The disconnecting equipment shall have a rating suitable for the connected load. The distribution equipment, either circuit breaker or fused type, shall be located a minimum of 24 in. (610 mm) from the bottom of such equipment to the floor level of the mobile home.

FPN: See Section 550.~~15~~ 20(B) for information on disconnecting means for branch circuits designed to energize heating or air-conditioning equipment, or both, located outside the mobile home, other than room air conditioners.

A distribution panelboard shall be rated not less than 50 amperes and employ a 2-pole circuit breaker rated 40 amperes for a 40-ampere supply cord, or 50 amperes for a 50-ampere supply cord. A distribution panelboard employing a disconnect switch and fuses shall be rated 60 amperes and shall employ a single 2-pole, 60-ampere fuseholder with 40- or 50-ampere main fuses for 40- or 50-ampere supply cords, respectively. The outside of the distribution panelboard shall be plainly marked with the fuse size.

The distribution panelboard shall ~~be located in an accessible location but shall not be located in a bathroom or a clothes closet.~~ not be located in a bathroom or any inaccessible location, but shall be permitted just inside a closet entry if the location is such that a clear space of 6 in. (152 mm) is maintained in front of the distribution panelboard and the distribution panelboard can be extended to its full open position (at least 90 degrees). A clear working space at least 30 in. (762 mm) wide and 30 in. (762 mm) in front of the distribution panelboard shall be provided. This

space shall extend from the floor to the top of the distribution panelboard.

(B) Branch-Circuit Protective Equipment. Branch-circuit distribution equipment shall be installed in each mobile home and shall include overcurrent protection for each branch circuit consisting of either circuit breakers or fuses.

The branch-circuit overcurrent devices shall be rated as follows:

(1) Not more than the circuit conductors; and

(2) Not more than 150 percent of the rating of a single appliance rated 13.3 amperes or more that is supplied by an individual branch circuit; but

(3) Not more than the overcurrent protection size and of the type marked on the air conditioner or other motor-operated appliance.

~~A 15-ampere multiple receptacle shall be permitted where connected to a 20-ampere laundry circuit.~~

(C) Two-Pole Circuit Breakers. Where circuit breakers are provided for branch-circuit protection, 240-volt circuits shall be protected by a 2-pole common or companion trip, or handle-tied paired circuit breakers.

(D) Electrical Nameplates. A metal nameplate on the outside adjacent to the feeder assembly entrance shall read:

THIS CONNECTION FOR 120/240-VOLT,
3-POLE, 4-WIRE, 60 HERTZ, _____ AMPERE
SUPPLY

The correct ampere rating shall be marked in the blank space.

Exception: For manufactured homes, the manufacturer shall provide in its written installation instructions the minimum ampere rating of the feeder assembly or, where provided, the service entrance conductors intended for connection to the manufactured home. The rating provided shall not be less than the minimum load calculated in accordance with 550.18.

550.~~7~~ 12 Branch Circuits.

The number of branch circuits required shall be determined in accordance with (a) through ~~(c).~~ (e).

(A) Lighting. Based on 3 volt-amperes/ft^2 (32.26 VA/m^2) times outside dimensions of the mobile home (coupler excluded) divided by 120 volts to determine the number of 15- or 20-ampere lighting area circuits, e.g.,

$$\frac{3 \times \text{length} \times \text{width}}{120 \times 15 \text{ (or } 20)} = \text{No. of 15- (or 20-) ampere circuits}$$

The lighting circuits shall be permitted to serve built-in gas ovens with electric service only for lights, clocks or timers, or listed cord-connected garbage disposal units.

(B) Small Appliances. ~~Small appliance branch circuits shall be installed in accordance with Section 210 52(b).~~ For the small appliance load in kitchens, pantries, dining rooms, and breakfast rooms, two or more 20-ampere appliance branch circuits, in addition to the number of branch circuits required by other parts of this section shall be provided for all receptacle outlets required by 550.13(D) in these rooms. Such circuits shall have no other outlets.

Exception No. 1: A receptacle installed solely for the electrical supply to and support of an electric clock in any of the rooms specified above.

Exception No. 2: Receptacles installed to provide power for supplemental equipment and lighting on gas-fired ranges, ovens, or counter-mounted cooking units

Countertop receptacle outlets installed in the kitchen shall be supplied by not less than two small appliance branch circuits, either or both of which shall be permitted to supply receptacle outlets in the kitchen and other rooms specified above.

(C) Laundry Area. Where a laundry area is provided, a 20-ampere branch circuit shall be provided to supply the laundry receptacle outlet(s).

~~(c)~~ **(D) General Appliances.** (Including furnace, water heater, range, and central or room air conditioner, etc.) There shall be one or more circuits of adequate rating in accordance with the following.

~~FPN No. 1: For the laundry branch circuit, see Section 210-11(c)(2).~~

FPN ~~No. 2~~: For central air conditioning, see Article 440.

(1) Ampere rating of fixed appliances not over 50 percent of circuit rating if lighting outlets (receptacles, other than kitchen, dining area, and laundry, considered as lighting outlets) are on the same circuit.

(2) For fixed appliances on a circuit without lighting outlets, the sum of rated amperes shall not exceed the branch-circuit rating. Motor loads or other continuous duty loads shall not exceed 80 percent of the branch-circuit rating.

(3) The rating of a single cord- and plug-connected appliance on a circuit having no other outlets shall not exceed 80 percent of the circuit rating.

(4) The rating of a range branch circuit shall be based on the range demand as specified for ranges in ~~Section~~ 550.~~13~~ 18(B)(5).

(E) Bathrooms. Bathroom receptacle outlets shall be supplied by at least one 20-ampere branch circuit. Such circuits shall have no other outlets other than as provided for in 550.13(E)(2).

550.~~8~~ 13 Receptacle Outlets.

(A) Grounding-Type Receptacle Outlets. All receptacle outlets shall:

(1) ~~shall~~ B~~b~~e of grounding type.

(2) ~~shall~~ B~~b~~e installed according to ~~Section~~ 210.7.

(3) E~~e~~xcept where supplying specific appliances, ~~receptacles shall~~ be 15- or 20-ampere, 125-volt, either single or duplex, and ~~shall~~ accept parallel-blade attachment plugs.

(B) Ground-Fault Circuit Interrupters (GFCI). All ~~120~~ 125-volt, single-phase, 15- and 20-ampere receptacle outlets installed outdoors or in compartments accessible from outside the unit, and in bathrooms, including receptacles in light fixtures, shall have ~~ground-fault circuit interrupter~~ GFCI protection for personnel. ~~Ground-fault circuit interrupter~~ GFCI protection for personnel shall be provided for receptacle outlets ~~located within 6 ft (1.83 m) of any lavatory or sink~~. serving countertops in kitchens, and receptacle outlets located within 6 ft (1.83 m) of a wet bar sink.

Exception: Receptacles installed for appliances in dedicated spaces, such as for dishwashers, disposals, refrigerators, freezers, and laundry equipment.

~~No receptacle shall be required in the area occupied by a toilet, shower, tub, or any combination thereof. If a receptacle is installed in such an area, it shall have ground-fault circuit-interrupter protection for personnel.~~

Feeders supplying branch circuits shall be permitted to be protected by a ground-fault circuit-interrupter in lieu of the provision for such interrupters specified herein.

(C) Cord-Connected Fixed Appliance. A grounding-type receptacle outlet shall be provided for each cord-connected fixed appliance installed.

~~(d) Required Receptacle Outlets. Receptacle outlets shall be provided in all rooms other than the bath, closet, and hall areas, and shall be installed so that no point along the floor line is more than 6 ft (1.83 m) measured horizontally from an outlet in that space. Countertops shall have receptacles located every 6 ft (1.83 m). The contiguous measurement of countertop and floor line shall be permitted where measured from the required receptacle in rooms requiring small appliance circuits. Receptacle outlets on small appliance circuits shall not be included in determining the spacing for receptacle outlets of other circuits.~~

~~Exception No. 1: Where the measured distance is interrupted by an interior doorway, sink, refrigerator, range, oven, or cooktop, an additional receptacle outlet shall be provided where the interrupted space is at least 2 ft (610 mm) wide at the floor line and at least 12 in. (305 mm) wide at the countertop.~~

~~Exception No. 2: Receptacles rendered not readily accessible by stationary appliances shall not be considered as the required outlets.~~

~~Exception No. 3: The distance along a floor line occupied by a door opened fully against that space shall not be required to be included in establishing the horizontal measurement if the door swing is limited to 90 degrees nominal by that wall space.~~

~~Exception No. 4: Receptacle requirements for bar-type counters and for fixed room dividers shall be permitted to be provided by a receptacle outlet in the wall at the nearest point where the counter or room divider attaches to the wall provided the following:~~

~~a. The divider does not exceed 8 ft (2.44 m) in length; and~~

~~b. The divider does not exceed 4 ft (1.22 m) in height; and~~

~~c. The divider is attached to a wall at one end only.~~

(D) Receptacle Outlets Required. Except in the bath, closet, and hall areas, receptacle outlets shall be installed at wall spaces 2 ft (610 mm) wide or more so that no point along the floor line is more than 6 ft (1.83 m) measured horizontally from an outlet in that space. In addition, a receptacle outlet shall be installed in the following locations:

(1) Over or adjacent to countertops in the kitchen [at least one on each side of the sink if countertops are on each side and are 12 in. (305 mm) or over in width].

(2) Adjacent to the refrigerator and freestanding gas-range space. A duplex receptacle shall be permitted to serve as the outlet for a countertop and a refrigerator.
(3) At countertop spaces for built-in vanities.
(4) At countertop spaces under wall-mounted cabinets.
(5) In the wall at the nearest point to where a bar-type counter attaches to the wall.
(6) In the wall at the nearest point to where a fixed room divider attaches to the wall
(7) In laundry areas within 6 ft (1.83 m) of the intended location of the laundry appliance(s).
(8) At least one receptacle outlet outdoors accessible at grade level and not more than 6 1/2 ft (1.98 m) above grade. A receptacle outlet located in a compartment accessible from the outside of the unit shall be considered an outdoor receptacle.
(9) At least one wall receptacle outlet shall be installed in bathrooms within 36 in. (914 mm) of the outside edge of the basin. The receptacle outlet shall be located on a wall that is adjacent to the basin location.

(E) Pipe Heating Cable(s) Outlet For the connection of pipe heating cable(s), a receptacle outlet shall be located on the underside of the unit as follows:
(1) Within 2 ft (610 mm) of the cold water inlet.
(2) Connected to an interior branch circuit, other than a small appliance branch circuit. It shall be permitted to utilize a bathroom receptacle circuit for this purpose.
(3) On a circuit where all of the outlets are on the load side of the ground-fault circuit-interrupter.
(4) This outlet shall not be considered as the receptacle required by 550.~~8~~13(D)(8).

~~(e) Outdoor Receptacle Outlets. At least one receptacle outlet shall be installed outdoors. A receptacle outlet located in a compartment accessible from the outside of the mobile home shall be considered an outdoor receptacle. Outdoor receptacle outlets shall be protected as required in Section 550 8(b).~~

(F) Receptacle Outlets Not Permitted. Receptacle outlets shall not be permitted in the following locations:
(1) Shower or Bathtub Space. Receptacle outlets shall not be installed in or within reach [30 in. (762 mm)] of a shower or bathtub space.
(2) Face-Up Position. A receptacle shall not be installed in a face-up position in any countertop.
(3) Receptacle outlets shall not be installed above electric baseboard heaters, unless provided for in the listing or manufacturers instructions.

(G) Receptacle Outlets not Required. Receptacle outlets shall not be located in the following locations:
(1) In the wall space occupied by built-in kitchen or wardrobe cabinets.
(2) In the wall space behind doors that can be opened fully against a wall surface.
(3) In room dividers of the lattice type that are less than 8 ft (2.44 m) long, not solid, and within 6 in. (152 mm) of the floor.
(4) In the wall space afforded by bar-type counters.

~~(g) Pipe Heating Cable Outlet. Where a pipe heating cable outlet is installed, the outlet shall be as follows:~~
~~1. Located within 2 ft (610 mm) of the cold water inlet.~~
~~2. Connected to an interior branch circuit, other than a small appliance branch circuit. It shall be permitted to utilize a bathroom receptacle circuit for this purpose.~~
~~3. On a circuit where all of the outlets are on the load side of the ground fault circuit interrupter protection for personnel.~~
~~4. Mounted on the underside of the mobile home and shall not be considered to be the outdoor receptacle outlet required in Section 550 8(e).~~

550.~~9~~14 Fixtures and Appliances.

(A) Fasten Appliances in Transit. Means shall be provided to securely fasten appliances when the mobile home is in transit. (See ~~Section~~ 550.~~11~~ 16 for provisions on grounding.)

(B) Accessibility. Every appliance shall be accessible for inspection, service, repair, or replacement without removal of permanent construction.

~~(c) Pendants. Pendant-type fixtures or pendant cords shall be listed and identified for the interconnection of building components.~~

(C) Pendants. Listed pendant-type fixtures or pendant cords shall be permitted.

(D) Bathtub and Shower Fixtures. Where a lighting fixture is installed over a bathtub or in a shower stall, it shall be of the enclosed and gasketed type listed for wet locations.

~~(e) Location of Switches. The switch for shower lighting fixtures and exhaust fans located over a tub or in a shower stall shall be located outside the tub or shower space.~~

550.~~10~~ 15 Wiring Methods and Materials.

Except as specifically limited in this section, the wiring methods and materials included in this Code shall be used in mobile homes. Aluminum conductors, aluminum alloy conductors, and aluminum core conductors such as copper-clad aluminum shall not be acceptable for use as branch-circuit wiring.

(A) Nonmetallic Boxes. Nonmetallic boxes shall be permitted only with nonmetallic cable or nonmetallic raceways.

(B) Nonmetallic Cable Protection. Nonmetallic cable located 15 in. (381 mm) or less above the floor, if exposed, shall be protected from physical damage by covering boards, guard strips, or raceways. Cable likely to be damaged by stowage shall be so protected in all cases.

(C) Metal-Covered and Nonmetallic Cable Protection. Metal-covered and nonmetallic cables shall be permitted to pass through the centers of the wide side of 2 in. by 4 in. (50 mm x 100 mm) studs. However, they shall be protected where they pass through 2 in. by 2 in. (50 mm x 50 mm) studs or at other studs or frames where the cable or armor would be less than 1 1/4 in. (31.8 mm) from the inside or outside surface of the studs where the wall covering materials are in contact with the studs. Steel plates on each side of the cable, or a tube, with not less than No. 16 MSG wall thickness shall be required to protect the cable. These plates or tubes shall be securely held in place.

(D) Metal Faceplates. Where metal faceplates are used, they shall be effectively grounded.

(E) Installation Requirements. If a range, clothes dryer, or similar appliance is connected by metal-covered cable or flexible metal conduit, a length of not less than 3 ft (914 mm) of free cable or conduit shall be provided to permit moving the appliance. The cable or flexible metal conduit shall be secured to the wall. Type NM or Type SE cable shall not be used to connect a range or dryer. This shall not prohibit the use of Type NM or Type SE cable between the branch-circuit overcurrent-protective device and a junction box or range or dryer receptacle.

(F) Raceways. Where rigid metal conduit or intermediate metal conduit is terminated at an enclosure with a locknut and bushing connection, two locknuts shall be provided, one inside and one outside of the enclosure. Rigid nonmetallic conduit, or electrical nonmetallic tubing, or surface raceway shall be permitted. All cut ends of conduit and tubing shall be reamed or otherwise finished to remove rough edges.

(G) Switches. Switches shall be rated as follows:
(1) For lighting circuits, switches shall be rated not less than 10 amperes, 120 to 125 volts, and in no case less than the connected load.
(2) For motors or other loads, switches shall have ampere or horsepower ratings, or both, adequate for loads controlled. (An ac general-use snap switch shall be permitted to control a motor 2 hp or less with full-load current not over 80 percent of the switch ampere rating.)

(H) Under-Chassis Wiring (Exposed to Weather).
~~1.~~ Where outdoor or under-chassis line-voltage (120 volts, nominal, or higher) wiring is exposed to moisture or physical damage, it shall be protected by rigid metal conduit or intermediate metal conduit. The conductors shall be suitable for wet locations.
Exception: Electrical metallic tubing or rigid nonmetallic conduit shall be permitted where closely routed against frames and equipment enclosures.
~~2. The cables or conductors shall be Type NMC, Type TW, or equivalent.~~

(I) Boxes, Fittings, and Cabinets. Boxes, fittings, and cabinets shall be securely fastened in place and shall be supported from a structural member of the home, either directly or by using a substantial brace.
Exception: Snap-in-type boxes. Boxes provided with special wall or ceiling brackets and wiring devices with integral enclosures that securely fasten to walls or ceilings and are identified for the use shall be permitted without support from a structural member or brace. The testing and approval shall include the wall and ceiling construction systems for which the boxes and devices are intended to be used.

(J) Appliance Terminal Connections. Appliances having branch-circuit terminal connections that operate at temperatures higher

than 60ºC (140ºF) shall have circuit conductors as described in ~~(1) or (2).~~ the following:

(1) Branch-circuit conductors having an insulation suitable for the temperature encountered shall be permitted to be run directly to the appliance.

(2) Conductors having an insulation suitable for the temperature encountered shall be run from the appliance terminal connection to a readily accessible outlet box placed at least 1 ft (305 mm) from the appliance. These conductors shall be in a suitable raceway or Type AC or MC cable of at least 18 in. (450 mm) but not more than 6 ft (1.83 m) in length. ~~that shall extend for at least 4 ft (1.22 m).~~

(K) Component Interconnections. Fittings and connectors that are intended to be concealed at the time of assembly shall be listed and identified for the interconnection of building components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstanding and shall be capable of enduring the vibration and shock occurring in mobile home transportation.

FPN: See 550.19 for interconnection of multiple section units.

550.~~11~~16 Grounding.

Grounding of both electrical and nonelectrical metal parts in a mobile home shall be through connection to a grounding bus in the mobile home distribution panelboard. The grounding bus shall be grounded through the green-colored insulated conductor in the supply cord or the feeder wiring to the service ground in the service-entrance equipment located adjacent to the mobile home location. Neither the frame of the mobile home nor the frame of any appliance shall be connected to the grounded circuit conductor (neutral) in the mobile home. Where service equipment is installed in or on a manufactured home as permitted in 550.32(B), the neutral conductors and the ground bus shall be permitted to be connected in the distribution panel.

(A) Grounded (Neutral) Conductor. ~~Insulated Neutral.~~

(1) Insulated. The grounded circuit conductor (neutral) shall be insulated from the grounding conductors and from equipment enclosures and other grounded parts. The grounded (neutral) circuit terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded. Where service equipment is installed in or on a manufactured home as permitted in 550.32(B), the neutral conductors and the ground bus shall be permitted to be connected in the distribution panel.

(2) Connections of Ranges and Clothes Dryers. Connections of ranges and clothes dryers with 120/240-volt, 3-wire ratings shall be made with 4-conductor cord and 3-pole, 4-wire, grounding-type plugs or by Type AC cable, Type MC cable, or conductors enclosed in flexible metal conduit.

(B) Equipment Grounding Means.

(1) Supply Cord or Permanent Feeder. The green-colored insulated grounding wire in the supply cord or permanent feeder wiring shall be connected to the grounding bus in the distribution panelboard or disconnecting means.

(2) Electrical System. In the electrical system, all exposed metal parts, enclosures, frames, lamp fixture canopies, etc., shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard.

(3) Cord-Connected Appliances. Cord-connected appliances, such as washing machines, clothes dryers, refrigerators, and the electrical system of gas ranges, etc., shall be grounded by means of a cord with grounding conductor and grounding-type attachment plug.

(C) Bonding of Noncurrent-Carrying Metal Parts.

(1) Exposed Noncurrent-Carrying Metal Parts. All exposed noncurrent-carrying metal parts that may become energized shall be effectively bonded to the grounding terminal or enclosure of the distribution panelboard. A bonding conductor shall be connected between the distribution panelboard and accessible terminal on the chassis.

(2) Grounding Terminals. Grounding terminals shall be of the solderless type and listed as pressure-terminal connectors recognized for the wire size used. The bonding conductor shall be solid or stranded, insulated or bare, and shall be No. 8 copper minimum, or equivalent. The bonding conductor shall be routed so as not to be exposed to physical damage.

(3) Metallic Piping and Ducts. Metallic gas, water, and waste pipes and metallic air-circulating ducts shall be considered bonded if they are connected to the terminal on the chassis [see ~~Section~~ 550.~~11~~16(C)(1)] by clamps, solderless connectors, or by suitable grounding-type straps.

(4) Metallic Roof and Exterior Coverings. Any metallic roof and exterior covering shall be considered bonded if the following conditions are met:

(1) T~~t~~he metal panels overlap one another and are securely attached to the wood or metal frame parts by metallic fasteners ~~and~~

(2) I~~i~~f the lower panel of the metallic exterior covering is secured by metallic fasteners at a cross member of the chassis by two metal straps per mobile home unit or section at opposite ends.

The bonding strap material shall be a minimum of 4 in. (102 mm) in width of material equivalent to the skin or a material of equal or better electrical conductivity. The straps shall be fastened with paint-penetrating fittings such as screws and starwashers or equivalent.

550.~~12~~17 Testing.

(a) Dielectric Strength Test. The wiring of each mobile home shall be subjected to a 1-minute, 900-volt, dielectric strength test (with all switches closed) between live parts (including neutral) and the mobile home ground. Alternatively, the test shall be permitted to be performed at 1080 volts for 1 second. This test shall be performed after branch circuits are complete and after fixtures or appliances are installed.

Exception: Listed fixtures or appliances shall not be required to withstand the dielectric strength test.

(B) Continuity and Operational Tests and Polarity Checks. Each mobile home shall be subjected to all of the following:

(1) An electrical continuity test to ensure that all exposed electrically conductive parts are properly bonded.

(2) An electrical operational test to demonstrate that all equipment, except water heaters and electric furnaces, is connected and in working order~~.; and~~

(3) Electrical polarity checks of permanently wired equipment and receptacle outlets to determine that connections have been properly made.

550.~~13~~ 18 Calculations. The following method shall be employed in computing the supply-cord and distribution-panelboard load for each feeder assembly for each mobile home in lieu of the procedure shown in Article 220 and shall be based on a 3-wire, 120/240-volt supply with 120-volt loads balanced between the two legs of the 3-wire system.

(A) Lighting ~~and~~, Small Appliance, and Laundry Load.

(1) Lighting Volt-Amperes~~:~~. Length times width of mobile home floor (outside dimensions) times 3 volt-amperes/ft^2 (32.26 VA/m^2), e.g., Length x width x 3 = lighting volt-amperes

(2) Small Appliance Volt-Amperes~~:~~. Number of circuits times 1500 volt-amperes for each 20-ampere appliance receptacle circuit (see definition of Appliance, Portable with note~~) including 1500 volt-amperes for laundry circuit~~, e.g., No. of circuits x 1500 = small appliance volt-amperes.

(3) Laundry Area Circuit Volt-Amperes. 1500 volt-amperes

(4) Total Volt-Amperes~~:~~. Lighting volt-amperes plus small appliance volt-amperes plus laundry area volt-amperes = total volt-amperes.

(5) Net Volt-Amperes. First 3000 total volt-amperes at 100 percent plus remainder at 35 percent = volt-amperes to be divided by 240 volts to obtain current (amperes) per leg.

(B) Total Load for Determining Power Supply. Total load for determining power supply is the sum of the following~~:~~.

(1) Lighting and small appliance load as calculated in ~~Section~~ 550.~~13~~18(A)(5).

(2) Nameplate amperes for motors and heater loads (exhaust fans, air conditioners, electric, gas, or oil heating). Omit smaller of the heating and cooling loads, except include blower motor if used as air-conditioner evaporator motor. Where an air conditioner is not installed and a 40-ampere power-supply cord is provided, allow 15 amperes per leg for air conditioning.

(3) Twenty-five percent of current of largest motor in (2).

(4) Total of nameplate amperes for waste disposer, dishwasher, water heater, clothes dryer, wall mounted oven, cooking units. Where the number of these appliances exceeds three, use 75 percent of total.

(5) Derive amperes for freestanding range (as distinguished from separate ovens and cooking units) by dividing the following values by 240 volts.

Nameplate Rating (watts)	Use (volt-amperes)
0 – 10,000	80 percent of rating
Over 10,000 – 12,500	8,000
Over 12,500 – 13,500	8,400
Over 13,500 – 14,500	8,800
Over 14,500 – 15,500	9,200
Over 15,500 – 16,500	9,600
Over 16,500 – 17,500	10,000

(6) If outlets or circuits are provided for other than factory-installed appliances, include the anticipated load.
FPN: Refer to Appendix D, Example D11, for an illustration of the application of this calculation.

(C) Optional Method of Calculation for Lighting and Appliance Load. ~~For mobile homes,~~ T~~t~~he optional method for calculating lighting and appliance load shown in ~~Section~~ 220.30 shall be permitted.

550.~~14~~19 Interconnection of Multiple Section Mobile or Manufactured Home Units.

(A) Wiring Methods. Approved and listed fixed-type wiring methods shall be used to join portions of a circuit that must be electrically joined that are located in adjacent sections ~~of mobile homes~~ after the home is installed on its support foundation. The circuit's junction shall be accessible for disassembly when the home is prepared for relocation.

FPN: See 550.15(K) for component interconnections.

(B) Disconnecting Means. Expandable or multi-unit manufactured homes not having permanently installed feeders that are to be moved from one location to another shall be permitted to have disconnecting means with branch-circuit protective equipment in each unit when so located that after assembly or joining together of units, the requirements of 550.5 will be met.

550.~~15~~20 Outdoor Outlets, Fixtures, Air-Cooling Equipment, etc.

(A) Listed for Outdoor Use. Outdoor fixtures and equipment shall be listed for outdoor use. Outdoor receptacle or convenience outlets shall be of a gasketed-cover type for use in wet locations. Where located on the underside of the home or located under roof extensions or similarly protected locations, outdoor fixtures and equipment shall be listed for use in damp locations.

(B) Outside Heating Equipment, Air-Conditioning Equipment, or Both. A mobile home provided with a branch circuit designed to energize outside heating equipment or air-conditioning equipment, or both, located outside the mobile home, other than room air conditioners, shall have such branch-circuit conductors terminate in a listed outlet box, or disconnecting means, located on the outside of the mobile home. A label shall be permanently affixed adjacent to the outlet box and shall contain the following information:

THIS CONNECTION IS FOR HEATING AND/OR AIR-CONDITIONING EQUIPMENT. THE BRANCH CIRCUIT IS RATED AT NOT MORE THAN _____ AMPERES, AT _____ VOLTS, 60-HERTZ, _____ CONDUCTOR AMPACITY. A DISCONNECTING MEANS SHALL BE LOCATED WITHIN SIGHT OF THE EQUIPMENT.

The correct voltage and ampere rating shall be given. The tag shall be not less than 0.020-in. (508-µm) thick etched brass, stainless steel, anodized or alclad aluminum, or equivalent. The tag shall not be less than 3 in. (76 mm) by 1 3/4 in. (44.5 mm) minimum size.

Exception: For manufactured homes, the manufacturer shall provide in its written installation instructions the location of the outlet box or disconnecting means, the ampere rating of the branch circuit conductors provided, and the voltage rating of the circuit (e.g., 120,240, or 120/240 volts).

III Services and Feeders

550.~~21~~30 Distribution System.

The mobile home park secondary electrical distribution system to mobile home lots shall be single-phase, 120/240 volts, nominal. For the purpose of Part ~~C~~ III, where the park service exceeds 240 volts, nominal, transformers and secondary distribution panelboards shall be treated as services.

550.~~22~~31 Minimum Allowable Demand Factors.

Park electrical wiring systems shall be calculated (at 120/240 volts) on the larger of the following:

(1) 16,000 volt-amperes for each mobile home lot ~~or.~~

(2) T~~t~~he load calculated in accordance with Section 550.~~13~~ 18 for the largest typical mobile home that each lot will accept.

It shall be permissible to compute the feeder or service load in accordance with Table 550.~~22~~ 31. No demand factor shall be allowed for any other load, except as provided in this Code.

Service and feeder conductors to a mobile home in compliance with ~~Section~~ 310.15(B)(6) shall be permitted.

Table 550.~~22~~ 31. Demand Factors for Feeders and Service-Entrance Conductors

Number of Mobile Homes	Demand Factor (percent)
	1100
2	55
3	44
4	39
5	33
6	29
7–9	28
10–12	27
13–15	26
16–21	25
22–40	24
41–60	23
61 and over	22

550.~~23~~32 Service Equipment.

(A) Mobile Home Service Equipment. The mobile home service equipment shall be located adjacent to the mobile home and not mounted in or on the mobile home. The service equipment shall be located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves. The service equipment shall be permitted to be located elsewhere on the premises, provided that a disconnecting means suitable for service equipment is located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves. Grounding at the disconnecting means shall be in accordance with ~~Section~~ 250.32.

(B) Manufactured Home Service Equipment. The manufactured home service equipment shall be permitted to be installed in or on a manufactured home, provided that all of the following conditions are met:~~.~~

~~1. The manufactured home is secured to a permanent foundation that complies with applicable building codes.~~

~~2. The service equipment is installed in a manner acceptable to the authority having jurisdiction.~~

~~3. The installation of the service equipment complies with Article 230.~~

~~4. Means are provided for the connection of a grounding electrode conductor to the service equipment and routing it outside the structure.~~

(1) The manufacturer shall include in its written installation instructions information indicating that the home shall be installed on and secured to a permanent foundation or anchoring system.

(2) The installation of the service equipment complies with Article 230.

(3) Means are provided for the connection of a grounding electrode conductor to the service equipment and routing it outside the structure.

(4) Bonding and grounding of the service shall be in accordance with Article 250.

(5) The manufacturer shall include in its written installation instructions one method of grounding the service equipment at the installation site. The instructions shall clearly state that other methods of grounding are found in Article 250.

(6) The minimum size grounding electrode conductor shall be specified in the instructions.

(7) A red warning label shall be mounted on or adjacent to the service equipment. The label shall state the following:
WARNING – DO NOT PROVIDE ELECTRICAL POWER UNTIL THE GROUNDING ELECTRODE(S) IS INSTALLED AND CONNECTED (SEE INSTALLATION INSTRUCTIONS).

Where the service equipment is not installed in or on the unit, the installation shall comply with the other provisions of this Section.

(C) Rating. Mobile home service equipment shall be rated at not less than 100 amperes at 120/240 volts, and provisions shall be made for connecting a mobile home feeder assembly by a permanent wiring method. Power outlets used as mobile home service equipment shall also be permitted to contain receptacles rated up to 50 amperes with appropriate overcurrent protection. Fifty-ampere receptacles shall conform to the configuration shown in Figure 550.~~5~~ 10(C).

FPN: Complete details of the 50-ampere plug and receptacle configuration can be found in National Electrical Manufacturers Association Standard for Wiring Devices — Dimensional Requirements, ANSI/NEMA WD 6-1988, Figure 14-50.

(D) Additional Outside Electrical Equipment Mobile home service equipment shall also contain a means for connecting a mobile home accessory building or structure, or additional electrical equipment located outside a mobile home by a fixed wiring method.

(E) Additional Receptacles. Additional receptacles shall be permitted for connection of electrical equipment located outside the mobile home, and all such 125-volt, single-phase, 15- and 20-ampere receptacles shall be protected by a listed ground-fault circuit interrupter.

(F) Mounting Height. Outdoor mobile home disconnecting means shall be installed so the bottom of the enclosure containing the disconnecting means is not less than 2 ft (610 mm) above finished grade or working platform. The disconnecting means shall be installed so that the center of the grip of the operating handle, when in the highest position, will not be more than 6 ft 7 in. (2.0 m) above the finished grade or working platform.

(G) Marking. Where a 125/250-volt receptacle is used in mobile home service equipment, the service equipment shall be marked as follows.

TURN DISCONNECTING SWITCH OR CIRCUIT BREAKER OFF BEFORE INSERTING OR REMOVING PLUG. PLUG MUST BE FULLY INSERTED OR REMOVED.

The marking shall be located on the service equipment adjacent to the receptacle outlet.

550.~~24~~ 33 Feeder.

(A) Feeder Conductors. ~~Mobile home~~ Ffeeder conductors shall consist of either a listed cord, factory-installed in accordance with Section 550.~~5~~ 10(B), or a permanently installed feeder consisting of four, insulated, color-coded conductors that shall be identified by the factory or field marking of the conductors in compliance with ~~Section~~ 310.12. Equipment grounding conductors shall not be identified by stripping the insulation.

Exception: Where a ~~mobile home~~ feeder is installed between service equipment and a ~~mobile home~~ disconnecting means as covered in ~~Section~~ 550.~~23~~ 32(A), it shall be permitted to omit the equipment grounding conductor where the grounded circuit conductor is grounded at the disconnecting means as required in ~~Section~~ 250.32(B).

(B) Adequate Feeder Capacity. Mobile home and manufactured home lot feeder circuit conductors shall have adequate capacity for the loads supplied and shall be rated at not less than 100 amperes at 120/240 volts.

SUBSTANTIATION:

This rewrite includes a general renumbering and other editorial changes such as adding section titles to comply with the new NEC Style Manual. These changes do not alter the technical content of the Article. There are other changes proposed that do change the technical content and they are listed below. Many of these changes are proposed to have the language of the NEC read the same as NFPA 501 and the HUD Part 3280 rules. There is a strong possibility that NFPA 501 will become the basis for the new HUD rules on manufactured housing either by reference or direct incorporation and since the federal rules are pre-emptive of the NEC rules, having a different set of requirements in the NEC serves no purpose. Many of the NFPA 501 and HUD rules were, and are derived from the NEC rules but there are several differences that have been deemed necessary to comply with federal mandates for manufactured housing.

Specific technical changes are as follows:

(Section numbers are based on the new numbering format of the Style Manual as shown in the proposal)

550.1 - The term "manufactured homes is added to the scope. This term appears in the title but is not directly mentioned in the existing scope. The only way to reference manufactured homes now is in the definitions in 550.2 and a few specific references elsewhere. It is felt that including them in the scope will help clarify what the article covers. A FPN is proposed to provide a reference directly in the scope to NFPA 501 and the HUD Part 3280 rules. The submitter understands that the Technical Correlating Committee has responsibility for "scope" sections.

550.2 - In the definition of Manufactured Home, the last line of text was moved above the FPN's for clarity.

Part B. title – renumbered as II and added the words Manufactured Homes to the title again to clarify that these units are indeed covered by this part.

Section numbers and internal references to other sections have been renumbered to comply with the new Style Manual.

550.10(I)(2) - New last sentence added to require the manufacturers instructions to state the proper conductor sizes and size of the junction box to be used. This is to be consistent with NFPA 501 and federal standards.

550.11(A) - Change in the second paragraph uses the language from NFPA 501 and HUD Part 3280 rules.

These documents allow a panelboard to be located in a closet with certain restrictions. It is intended that the six inch clear space be maintained by some physical means such as the design of the closet or closet rod.

550-11(B)(3) - Last sentence deleted as unnecessary. The issue is adequately covered in 210.21(B) and did not really belong in this section dealing with branch-circuit protective devices.

550-11(D) - Exception added for manufactured homes to be consistent with NFPA 501 and federal standards.

550-12(A) - Last sentence deleted. The subject is more clearly covered by other parts of this section. See 550-12(B) and 550.12(D).

550.12(B) - Section rewritten to use language from NFPA 501, federal standards, 210.11(C)(1), and 210.52(B) for consistency and clarity.

550.12(C) – New section added, old section (c) now designated as (D). Section added to state the requirement for laundry circuit rather than having to use FPN No. 1 from old section.

550.12(D) - FPN No. 1 deleted. Addition of new section makes it unnecessary. Existing FPN No. 2 now unnumbered.

550.12(E) - New section added to be consistent with NFPA 501 and federal standards. Reference to 550.13(E)(2) deals with specific permission for a pipe heating cable outlet to be installed on a bathroom receptacle circuit.

550.13(A) - Editorial changes to write in list format for clarity and comply with Style Manual.

550.13(B) - Change uses the acronym GFCI and incorporates language from 210.8(A) for GFCI requirements. Adds language from NFPA 501 and federal standards for consistency. Last sentence deleted so the rules would revert to 410.57(C) with regards to receptacles in tub and shower spaces.

550.13(D) - Section rewritten using language from NFPA 501 and federal standards for consistency and clarity. Removes confusing language and exceptions from current text. Basic text of new (8) is relocated from old section (e) which is deleted.

550.13(E) - Text relocated from old section (g)

550.13(F) - Rewritten in list format to comply with new Style Manual. Adds new section (3) from NFPA 501 which restates the FPN in 210.52 as text for clarity.

550.13(G) - New text from NFPA 501 and federal standards.

550.14(C) - Requirement restated. Original language was in error and had never been corrected, pendant fixtures or cords had nothing to do with interconnection of building components

550.14(e) - Old section deleted. Subject is adequately covered in 380.4.

550.15 - Text added from NFPA 501 and federal standards. Aluminum conductors have not been permitted in these units for some time.

550.15(C) - Metric equivalents added.

550.15(G) - editorial change to put into list format to comply with new Style Manual.

550.15(H) - Old section 2. deleted. Language is unnecessary as basic rule requires conductors be suitable for wet locations and other code rules in Chapter 1-4 require suitability for the location. Change is consistent with language from NFPA 501 and federal standards.

550.15(J) - Rewritten in list format to comply with new Style Manual. Changes in (2) reflect current NEC and NFPA 501 rules.

550.15(K) - FPN added to call users attention to related section for interconnections.

550.16 - New last sentence to correlate with existing provisions of 550.32(B) [old 550.23(b)] and to be consistent with NFPA 501 and federal standards.

550.16(A)(1) & (2) - Titles added to comply with new Style Manual. New last sentence added for consistency with NFPA 501, federal standards and existing provisions of 550.32(B) [old 550.23(b)].

550.16(B) - Titles added to sections to comply with new Style Manual

550.16(C) - Titles added to sections to comply with new Style Manual. (4) rewritten into list format to comply with new Style Manual.

550.17(B) - Rewritten into list format to comply with new Style Manual.

550.18 - Language "or manufactured" inserted to clarify that the calculation is applicable to either type of unit.

550.18(A) - Changes add specific reference to laundry load for clarity and to match the sample calculation shown in example D-11 and improve the usability of this section. Rewritten into format to comply with new Style Manual. Metric equivalent added. New title of (5) clarifies that this is a net value after applying the demand factor indicated.
550.18(C) - Specific reference to Mobile Homes is deleted to clarify that the optional calculation may be used for either type of unit.
550.19 - Manufactured homes added to title and specific reference to mobile homes is deleted in (A) to clarify the application of the requirement. FPN added to call users attention to related section on interconnections. Section Titles added to comply with new Style Manual. New section (B) added for consistency with NFPA 501 and federal standards.
550.20(A) - New last sentence added for consistency with NFPA 501 and federal standards.
550.20(B) - Exception added to be consistent with NFPA 501 and federal standards.
550.31 - Rewritten in list format to comply with new Style Manual.
550.32(B) - Revision uses text from the previous edition and add requirements from NFPA 501 and federal standards for consistency. New last sentence added to clarify that where the service equipment is not installed on the unit, it must comply with the remaining rules such as location, height, provisions for other equipment, and location of the service disconnecting means.
550.33(A) - Specific references to mobile homes are deleted to clarify that these provisions apply to both mobile and manufactured homes. There has been confusion in the past due to the wording contained in the definitions in 550.2.
550.33(B) - Manufactured homes added to clarify the applicability of the requirement.
PANEL ACTION: Accept in Principle.
Change the proposal as follows:
1. 550.11 (A) last paragraph - The distribution panelboard shall be located in an accessible location but shall not be located in a bathroom or clothes closet. Remainder of proposal text remains unchanged.
2. 550.11 (d) exception after "written installation instructions" add "or on the data plate"
Revise the proposal as follows:
3. 550.13 (D) (9) At least one receptacle outlet shall be installed in bathrooms within 36 in. (914mm) of the outside edge of each basin. The receptacle outlet shall be located above or adjacent to the basin location. This receptacle shall be in addition to any receptacle that is a part of a lighting or fixture or appliance. The receptacle shall not be enclosed within a bathroom cabinet or vanity.
4. 550.20 (B) Delete the exception.
5. 550.32 (b) (1) after existing text "be secured in place by an anchoring system or installed on and secured to a permanent foundation."
PANEL STATEMENT: The changes were made to ensure consistency with NFPA 501.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
COMMENT ON AFFIRMATIVE:
MCCULLOUGH: The Panel Action in 5, should state:
550.32(B)(1) delete the text after the word "shall" and replace with "be secured in place by an anchoring system or installed on and secured to a permanent foundation."
The Panel Action does not indicate that the wording shown is to replace the text in the proposal and this was the Panel's intent.

(Log #520)

19- 38 - (550): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 550-5,(d) replace "21 ft (6.4 m)" with "6.4 m (21 ft)"; "36 1/2 ft (11.13 m)" with "11 m (36 1/2 ft)"; and "20 ft (6.1 m)" with "6.0 m (20 ft)".
2. In Section 550-5(g), replace "1 1/4 in. (31.8 mm)" with "32 mm (1 1/4 in.)".
3. In Section 550-6, replace "1/4 in. (6.4 mm)" with "6 mm (1/4 in.)".
4. In Section 550-6(a) first paragraph, replace "24 in. (610 mm)" with "600 mm (24 in.)".
5. In Section 550-6(a) last paragraph, replace "30 in. (762 mm)" with "750 mm (30 in.)" throughout.
6. In Section 550-7(a), replace "3 volt-amperes/ft^2 (32.26 VA/m^2)" with "33 VA/m^2 (3 volt-amperes/ft^2)".
7. In Section 550-8(b), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
8. In Section 550-8(d), replace "6 ft (1.83 m)" with "1.8 m (6 ft)" throughout.
9. In Section 550-8(d) Exception No. 1, replace "2 ft (610 mm)" with "600 mm (2 ft)" and replace "12 in. (305 mm)" with "300 mm (12 in.)".
10. In Section 550-8(d) Exception No. 4, replace "8 ft (2.44 m)" with "2.5 m (8 ft)" in (a) and replace "4 ft (1.22 m)" with "1.2 m (4 ft)" in (b).
11. In Section 550-8(f)(1), replace "30 in. (762 mm)" with "750 mm (30 in.)".
12. In Section 550-8(g)(1), replace "2 ft (610 mm)" with "600 mm (2 ft)".
13. In Section 550-10(b), replace "15 in. (381 mm)" with "380 mm (15 in.)".
14. In Section 550-10(c), replace "2 in. by 4 in." with "2-by-4"; "2 in. by 2 in." with "2-by-2"; "1 1/4 in. (31.8 mm)" with "32 mm (1 1/4 in.)"; and "No. 16 MSG" with "1.35 mm (0.053 in.)".
15. In Section 550-10(e), replace "3 ft (914 mm)" with "900 mm (3 ft)".
16. In Section 550-10(j)(2), replace "1 ft (305 mm)" with "300 mm (1 ft)" and replace "4 ft (1.22 mm)" with "1.2 m (4 ft)".
17. In Section 550-11(c)(4), replace "4 in. (102 mm)" with "100 mm (4 in.)".
18. In Section 550-13(a), replace "3 volt-amperes/ft^2" with "33 VA/m^2 (3 volt-amperes/ft^2)".
19. In Section 550-15(b), replace "0.020-in. (508-µm)" with "0.51 mm (0.020 in.)"; "3 in. (76 mm)" with "75 mm (3 in.)"; and "1 3/4 in. (44.5 mm)" with "45 mm (1 3/4 in.)".
20. In Section 550-23(a), replace "30 ft (9.14 m)" with "9.0 m (30 ft.)" throughout.
21. In Section 550-23(f), replace "2 ft (610 mm)" with "600 mm (2 ft)" and replace "6 ft 7 in. (2.0 m)" with "2.0 m (6 ft 7 in.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following. The SI units and inch-pound numbers in parenthesis are not shown for Item 14's stud sizes since they are not a direct conversion and a Trade Size is provided. Also in Item 14, No. 16 MSG is considered to represent a nominal metal thickness, corresponding to a thickness value not commonly known or available to the users of the NEC. The equivalent nominal decimal thickness is 0.060 in., based on material standards and handbooks. However, since this value is nominal, a tolerance must be applied to achieve a minimum allowable thickness. The accepted industry practice is to apply a minus tolerance of 0.007 in. for 16 MSG, resulting in a minimum thickness of 0.053 in. (1.35 mm).
PANEL ACTION: Accept.

(Log #402)

19- 39 - (550-2-Manufactured Home): Accept
Note: The Technical Correlating Committee understands that the action on this proposal further modifies the action on Proposal 19-37. The Technical Correlating Committee further directs the Panel to clarify the use of "sq ft" relative to the use of SI units. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Charles N. Cook, Dept. of Housing & Community Dev./Codes Admin., MD
RECOMMENDATION: Revise definition of manufactured home to read as follows:
Manufactured Home. A structure, transportable in one or more sections, that is 8 body-ft (24.4 cm) or more in width or 40 body-ft (1219 cm) or more in length in the traveling mode or, when erected on site, is 320 ft^2 (28 m^2) or more; which is built on a chassis and designed to be used as a dwelling, with or without a permanent foundation, when connected to the required utilities, including the plumbing, heating, air conditioning, and electrical systems contained therein. Calculations used to determine the number of sq ft in a structure will be based on the structure's exterior dimensions, measured at the largest horizontal projections when erected on site. These dimensions include all expandable rooms, cabinets, and other projections containing interior space, but do not include inside bay windows.

SUBSTANTIATION: Standardization of definition.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.

19- 40 - (550-5(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Feeder. The power supply to the mobile home shall be a feeder assembly consisting of not more than one listed 50-ampere mobile home power supply cord with an integrally or securely attached plug cap, or a permanently installed feeder with an ampacity of not less than 50-amperes.
Exception No. 1: A mobile home that is factory-equipped with gas or oil-fired central heating equipment and cooking appliances shall be permitted to be provided with a listed mobile home power-supply cord rated 40 amperes, or a permanently installed feeder with an ampacity not less than 40 amperes.
SUBSTANTIATION: There is no specific minimum rating for a permanent feeder nor is a permanent feeder option indicated in Exception No. 1.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation does not further clarify requirements and existing text consistent with Federal installation standards.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #942)

19- 41 - (550-6(a), (b)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Disconnecting Means. A single main disconnecting means shall be provided in each mobile home, consisting of a circuit breaker or a switch and fuses and its their accessories, installed in a readily accessible location near the point of entrance of the supply cord or permanently installed feeder conductors into the mobile home. The main circuit breaker or switch and fuse enclosure shall be plainly and durably marked "main". A switch and fuse enclosure shall be plainly and durably marked with fuse rating. The equipment shall contain a solderless type grounding connector or bar for the purpose of grounding, with sufficient terminals for all grounding conductors. The neutral bar terminations of the grounded circuit conductors shall be insulated in accordance with Section 550-11(a). The main disconnecting equipment and overcurrent protection and distribution panelboard shall have an ampere rating not less than the rating of the mobile home feeder conductors. The bottom of the distribution equipment, either circuit breaker or fused type shall be located a minimum of 24 in. (610 mm) ~~from the bottom of such equipment~~ above the floor level of the mobile home.
(FPN): No change.
A distribution panelboard shall be rated not less than ~~50 amperes and employ a 2-pole circuit breaker rated 40 amperes for a 40 ampere rated supply cord, or 50 amperes for a 50 ampere supply cord~~ the ampere rating of the main circuit breaker or fuses. ~~A distribution panelboard employing a disconnect switch and fuses shall be rated 60 amperes and shall employ a single 2-pole 60 ampere fuseholder with 40- or 50 ampere main fuses for 40 or 50 ampere supply cords, respectively. The outside of the distribution panelboard shall be plainly marked with the fuse size.~~
The distribution equipment ~~panelboard~~ shall be located in a readily accessible location but shall not be located in a bathroom or clothes closet. A clear working space at least 30 in. (762 mm) wide and 30 in. (762 mm) in front of the distribution equipment ~~panelboard~~ shall be provided. This space shall extend from the floor to the top of the distribution equipment. ~~panelboard.~~
(b) Delete last paragraph: ~~A 15 ampere multiple receptacle shall be permitted where connected to a 20 ampere laundry circuit.~~
SUBSTANTIATION: Editorial. This section doesn't apply disconnecting means requirements to permanent feeders. The marking for "main" should be durable; felt pens and markers may not be suitable. Present wording literally requires the fuses to be marked. The suitable ratings for the disconnecting equipment should also apply to the main overcurrent device rating and the distribution panelboard which may be a separate device. Connected load is not necessarily the same as computed load. A circuit supplying general use receptacles or small appliance circuit receptacles is a computed load. The last sentence of the first paragraph is revised for improved syntax.
The proposal simplifies requirements and eliminates unnecessary text re: ratings and type of main disconnect overcurrent protection and type panelboard by relating these items to the feeder rating. Present text appears to require the main disconnect and overcurrent protection as part of the panelboard and doesn't address ratings where a permanent feeder is installed. The proposal uses "distribution equipment" in lieu of "distribution panelboard" to apply the requirements to a separate circuit breaker or fusible switch where installed, in addition to the panelboard. The present limitation of panelboard ratings would preclude using a 100-ampere rated panelboard to provide more circuit spaces, where supplied by a 50 ampere rated cord that has 50-ampere rated protection. Such application does not appear to violate other code rules.
The proposal to delete the last paragraph of (b) is because this is already permitted by Section 210-21 and it infers this is not permitted for other 20-ampere circuits supplying multiple receptacles or a single receptacle on a laundry circuit with other receptacles.
PANEL ACTION: Accept in Part.
Accept the delete in the last paragraph of 550-6(b).
PANEL STATEMENT: See panel action on proposal 19-37. The remainder of the existing text in (a) is sufficiently clear.

(Log #2034)

19- 43 - (550-6(b)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
RECOMMENDATION: Add to the end of the first paragraph:
"Branch circuit distribution equipment shall have a minimum of four unused spaces for the later installation of branch circuits."
SUBSTANTIATION: Branch circuits always get added. It is the rule, not the exception. The most common are water pumps, dishwashers and cellar lights. These spaces are desperately needed to avoid messes.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation addresses a design issue not a safety issue.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1453)

19- 44 - (550-6(e)): Reject
SUBMITTER: Barry F. Tower, Patten, ME
RECOMMENDATION: Please add the following new text:
(e) Overcurrent protection of branch circuit grounded conductors and equipment grounding conductors. Overcurrent protection of branch circuit grounded conductors and equipment grounding conductors of the panelboard shall be provided for mobile homes. The overcurrent protection shall interrupt ungrounded conductors, but never interrupt the continuity of any

grounding conductor. Overcurrent shall be detected and interrupted by use of one of the following means:

1. Ground-fault type circuit breakers located on each branch circuit of the panelboard.
2. A single ground-fault device installed as the main circuit breaker in the panelboard.
3. A single ground-fault device installed within the service equipment that supplies this panelboard.

Where a single ground-fault type device is used as permitted in 1 or 2 above, it shall be designed so that the ground-fault trip setting does not exceed 1 ampere.

SUBSTANTIATION: The purpose of this change is to prevent fires caused by "open neutrals" in mobile homes and buildings with subpanels. We all know about the dangers of short circuits, but we have been ignoring a much more serious problem. An open neutral feeding a four-wire 240/120V subpanel can start a fire if there is an interconnection between any branch circuit grounded neutral conductor and a grounding conductor. Open neutrals are a very common problem on mobile homes and buildings with subpanels, and accidental interconnections between a grounded conductor and a grounding conductor are even more common. Any such interconnection causes the grounded conductor and the grounding conductor to be in parallel with each other. A typical overload occurs as follows: The neutral conductor (may be rated at 100 amperes) becomes open, but instead of disconnecting the power, there is an alternate path for the circuit because the grounding conductor is accidentally connected in parallel with it. The neutral bus for the entire panelboard will be backfed through that alternate path (perhaps through no. 14 conductors in a device box). There is no overcurrent protection on the grounded conductor or the grounding conductor, so there is no warning until the fire starts. There are several ways in which a grounded neutral conductor can be made parallel with an equipment grounding conductor. The equipment grounding conductor may be in contact with the grounded conductor inside a device box. Any deflective appliance in which the neutral conductor is grounded to the case can burn down a building (if the neutral becomes open). Someone could have an appliance with a grounded neutral plugged in for many year and not know that they have any problem. Then one day their neutral becomes open and a fire starts. They had no warning and they had no way of knowing that the appliance was defective. Of course, this is only a problem on 4-wire subpanels and mobile homes. Now we have changed the requirements for ranges and dryers to require a 4-wire plug on all new homes. I agree that this is the proper wiring method. Unfortunately we have increased the fire hazard while decreasing the electrocution hazard. I think that more people die from house fires than from electrocution - thousands more each year. With a 3-wire range, there was a shock hazard if the neutral became open. A person complete the 120V path to ground by touching the case of the range. With a 4-wire range fed from a subpanel or mobile home, there is a fire hazard if the neutral becomes open and the bonding jumper on the back of the range is still attached. Most pigtails on ranges and dryers are installed by appliance delivery persons - not electricians. This proposal is the only way to protect the grounded circuit conductors and the equipment grounding conductors from overload where they are supplied from subpanels. Whenever I do any electrical work on a mobile home, I always shut off the power at the pole, disconnect the neutral, and test the neutral with an ohm meter to see if it is grounded - many of them were. It is not practical to expect people to do this once a month. Manufacturers could develop 2-pole GFCIs with a 1 ampere ground fault trip setting for this purpose.

PANEL ACTION: Reject.

PANEL STATEMENT: The recommendation is not supported by a technical substantiation.

Branch Circuits. Branch circuits shall be installed in accordance with (a) and (b) below.

(a) General Lighting. The minimum number of branch circuits to supply lighting and general-use receptacles shall be determined on the basis of 3 volt-amperes per sq ft (32.76 vA/sq m) of floor area computed from the outside dimensions of the mobile home (coupler excluded), divided by 120-volts, to determine the number of 15- or 20-ampere circuits, e.g.,

$$\frac{3 \times \text{length} \times \text{width}}{120 \times 15 \text{ (or } 20)} = \text{No. of 15- (or 20-) ampere circuits}$$

(b) Other Circuits. Installation of branch circuits shall be:

(1) In accordance with applicable requirements of Article 210,

(2) In accordance with Article 422 for appliances,

(3) Based on the range demand load specified in Section 550-13 (b)(5) for freestanding ranges.

SUBSTANTIATION: Mobile homes are dwelling units, per definition of dwelling unit, and merit the requirements for other type dwellings. The requirements of this section are much less comprehensive than Articles 210 and 422 and raise the question - how much of those articles are intended to apply? Are occupants of mobile homes second class citizens for which less stringent requirements are suitable?

A reference to Article 210 would encompass Section 210-2 which covers specific purpose branch circuits such as air-conditioning of FPN No. 2. A reference to Article 422 would clearly require a separate circuit for central heating equipment, not clearly defined by present (c), which also doesn't define adequate ampacity for a water heater as specified in Section 422-13. Subsection (c)(2) specifies a motor load (single or multiple) shall not exceed 80 percent of circuit rating; Section 430-24 only requires the multiplier for the largest motor. Continuous loads are not indicated.

Subsection (c)(3) negates Section 210-23 which permits an individual branch circuit to supply any load for which it is rated. The wording is flawed since it does not apply to an appliance on a circuit with one "outlet" containing multiple receptacles. Section 210-23 only applies the 80 percent restriction where other loads are also served.

The proposal is intended to clarify and correlate this section with other code rules.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirements in 550-7 have been developed to address the particular installations of mobile and manufactured homes. No technical substantiation was submitted to indicate that the present requirements are inadequate for these installations. See panel action on Proposal 19-37 which incorporates the language from the federal installation requirements for manufactured housing.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #944)

19- 46 - (550-8): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Delete present wording and substitute:

Receptacle Outlets. Receptacle outlets shall be installed in accordance with applicable provisions of Article 210 Part C and Article 410 Part L. A 15- or 20-ampere 125-volt receptacle located in a compartment and directly accessible from the outside of the mobile home shall be provided with ground-fault circuit-interruptor protection.

An outdoor outlet for a pipe heating cable shall be (1) located within 2 ft (610 mm) of the pipe; (2) supplied by an individual or multioutlet branch circuit (other than a small appliance laundry, bathroom, or central heating equipment branch circuit); (3) protected by a ground-fault circuit-interruptor device located within the mobile home; (4) not considered to be one of the outdoor receptacles required by Section 210-52(e).

SUBSTANTIATION: The proposal eliminates unnecessary text and correlates receptacle requirements with those for other type dwelling units.

The literal wording of (a) infers that 15- or 20-ampere 125-volt receptacles cannot supply specific appliances (washer, dryer, disposal, etc.)

Subsection (b) requires all 120-volt (should be 125-volt) receptacles in bathrooms to have GFCI protection; the last sentence limits this to receptacles within 6 ft of a sink or lavatory, which are not statements of clear intent.

The proposed second paragraph specifies "directly" accessible since any compartment is literally accessible from the outside simply by entering the mobile home.

The requirements for a heating cable outlet go beyond electrical safety requirements and apply design considerations. The requirement for all outlets on the supply circuit to have GFCI protection in effect requires a GFCI type circuit breaker at the panelboard or a GFCI type receptacle as the first outlet on the circuit. This is obviously for the purpose of alerting occupants of a tripped condition, and not required elsewhere in the code. Why not require a similar "alarm" for the furnace circuit? Loss of

heating in the middle of the night in subzero weather may present a greater safety concur for elderly or infirm occupants. Additionally, a deenergized circuit may not be noticed if no lighting or appliances are in use, and many persons may not be aware of how or where to reset a GFCI device. The likelihood of a tripped GFCI is greater with multiple outlet circuits. If reliability of operation is the goal, requirements for an individual circuit, direct or single-receptacle connection, location under the mobile home (ala 1996 code), and no GFCI protection appears to be a better approach.

In essence, the provisions of this section appear to discriminate against mobile home occupants by providing less stringent requirements for a dwelling unit than provided in Article 210.

For example, Section 210-8(a) requires GFCI protection for all counter-top receptacles, not just those within 6 ft of sinks. Section 410-57(c) prohibits a receptacle in a tub or shower space; (b) indicates one may be installed, yet (f) states it is not permitted. Section 210-52(a) includes wall space behind doors for receptacle placement which is excluded by (d) Exception No. 3. Section 210-52(c) requires receptacles at a minimum of every 4 ft; (d) requires receptacles every 6 ft. (closer spacing not permitted?). Sections 210-52(d)(e) and (h) require two receptacles outdoors, at least one in each bathroom, and includes hallways and (e) only requires one outdoor receptacle. Section 210-11(c)(3) requires bathroom branch circuits; (d) does not require a receptacle for such circuit. Section 210-52(f) requires a laundry receptacle; no such requirement in this section.

While the requirements of this article are primarily used by manufacturers there does not appear to be justification for rules which vary from those applicable to other type dwelling units.

PANEL ACTION: Reject.

PANEL STATEMENT: The requirements have been developed to address the particular installations of mobile and manufactured homes. No technical substantiation was submitted to indicate that the present requirements are inadequate for these installations. See panel action on Proposal 19-37 which incorporates the language from the federal installation requirements for manufactured housing.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #945)

19- 47 - (550-10(c), (f), (h)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(c) Delete present text and substitute: Raceway and Cable Protection. Raceways and cables installed through holes, in notches, or parallel to framing members shall comply with the requirements of Section 300-4(a) and (b).

(f) Raceways. Where rigid metal conduit or intermediate metal conduit is terminated at an enclosure with a locknut and bushing connection, two locknuts shall be provided, one inside and one outside of the enclosure. ~~Rigid nonmetallic conduit, or electrical nonmetallic tubing, or surface raceways shall be permitted.~~ All cut ends of conduit and tubing shall be reamed or otherwise finished to remove rough edges.

(h)(1) Exception: Electrical metallic tubing, rigid nonmetallic conduit, or Type MI cable shall be permitted where closely routed against frames and equipment enclosures.

SUBSTANTIATION: Editorial. Raceways are not indicated as permitted to pass through studs in (c) nor is there any requirement, therefore, for protection. The requirements of Section 300-4 are more comprehensive, including other framing members, metal framing members, and installations parallel to framing members.

If the requirements of Section 300-4 are deemed necessary for safety in other type dwelling units, why not mobile home dwelling units? Different requirements in Chapter 5 pertaining to similar installations with different rules in Chapter 3 are confusing when only the type of dwelling unit is different.

The second sentence of (f) is superfluous; already covered in the first paragraph. It suggests other raceways are not permitted even though the reference to RMC, IMC, and tubing indicates they are permitted.

Type MI cable is proposed for the exception since it is resistant to damage and moisture, is small in diameter, and there is no limit on number of bends.

PANEL ACTION: Reject.

PANEL STATEMENT: The existing text is sufficiently clear in determining the requirements. The requirements have been developed to address the particular installations of mobile and manufactured homes and be consistent with federal installation requirements. Where a requirement in chapter three is not modified by this section, the requirement is applicable to these installations.

(Log #2446)

19- 48 - (550-10(c) (New)): Reject

SUBMITTER: Patrick S. Ouillette, Maine Dept. of Professional and Financial Regulation

RECOMMENDATION: Add a new paragraph to 550-10(c) to read as follows:

"Where notches in accordance with Section 300-4(a)(2) are used on the exterior side of wood studs of outside walls, the protective plates shall extend at least 1 in. beyond the edges of the notched wood member."

SUBSTANTIATION: In the last three years, I investigated (3) fires in manufactured (HUD certified) homes that had a common origin. In all cases the occupants of the homes either smelled burning or heard sizzling in the exterior wall of the home. The fires were controlled quickly, which left significant evidence for investigation. In each case the origin was within the outside wall of the manufactured home, where an NM cable passed through notches made on the exterior side of the outside wall studs. The notches were protected with steel plates as required. There were no outlet points at the area of origin of the fires. In at least one case the cause was conclusive. A fastening staple for the vinyl siding had been driven into the cable and caused a short circuit. The staple penetrated the NM cable just beyond the edge of the protective plate. Like many manufactured homes, this home had no structural sheathing over the outside wall studs, but rather a nonstructural insulation board, necessitating fastening the siding into the studs. In an attempt to locate sound support, the installer probably tried fastening horizontally to the left or right when the plate was encountered. In another investigation, a portion of the cable that was not fire damaged contained holes that matched the siding staples used. The holes in the NM cable were spaces apart about the width of a stud; and the portion of cable between the holes was not as discolored as other portions, suggesting that the section of cable between the holes was probably located within the notch and afforded some degree of fire protection.

Some manufacturers of manufactured homes employ notches on the exterior side of outside wall studs as a labor savings measure. A wider protective plate would likely have prevented these three fires, while continuing to allow construction methods that help to control the cost of affordable housing. (See submitter's proposal with photos for Section 545-4, related to modular dwellings.)

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.

PANEL STATEMENT: The existing requirements have proven adequate in the vast majority of installations. The proposed change may or may not eliminate the situation that is reported to have occurred. The current language is consistent with federal installation standards.

(Log #1089)

19- 51 - (550-11(c)(2)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 8" to "8 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: The NEC Style of Manual does not specify the language used one way or another. The NFPA Manual of Style seems to prefer 10 AWG. Product standards use 10 AWG or 10 AWG 110-6 says that the conductor sizes are expressed in AWG or in circular mils so the AWG is implied. The panel recognizes that the TCC may desire to take a different action to be consistent with the Code.

(Log #2035)

19- 52 - (550-11(c)(2)): Reject
SUBMITTER: David A. Kerr, Jr., Friendsville, PA
RECOMMENDATION: Change the final sentence to read:
"The bonding conductor shall be closely routed along surfaces so as not to be exposed to physical damage."
SUBSTANTIATION: This requirement is routinely ignored by manufacturers. The frame bonding conductor routinely gets broken in transit.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided adequate substantiation for the proposed change.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #946)

19- 53 - (550-13): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Calculations. The following method shall be employed in computing the supply-cord or permanently installed feeder assembly and distribution ~~panelboard~~ equipment load ~~for each feeder assembly~~ for each mobile home in lieu of the procedure shown in Article 220 and shall be based on a 3-wire 120/240-volt supply with 120-volt loads balanced insofar as is practicable between the ~~two legs~~ ungrounded conductors of the 3-wire system.
SUBSTANTIATION: Editorial. The permanently installed feeder permitted in Section 550-5(a) should be specifically included. Where there is a separate main breaker or fused switch not part of the panelboard, distribution "equipment" would include those and the panelboard. It is not always practical to exactly balance loads. "Two legs" is not specific; one must infer the "hot" legs are intended.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing term "feeder assembly" by definition would include a permanently installed feeder. The current text is consistent with federal installation standards.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #947)

19- 54 - (550-15(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Listed for Outdoor Use. Outdoor receptacles, ~~or convenience outlets,~~ snap switches, and similar devices shall comply with the provisions of Sections 373-2(a), 380-4, and 410-57(a) and (b). ~~be of a gasketed cover type for wet locations.~~
SUBSTANTIATION: Editorial. "Convenience" is not defined; the term is commonly applied to a receptacle outlet. Since a snap switch may not be an "outlet" the requirement should include these and other devices. Present rule doesn't provide for damp locations and the specific conditions covered by the proposed references.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text is clear and precise. See Panel action on Proposal 19-37.

SUBMITTER: Michael Gregory Owen, Electrical Training & Consulting Service
RECOMMENDATION: Revise text to read:
550-22. ~~Minimum~~ Allowable Demand Factor "Maximum" or just "Allowable Demand Factor".
SUBSTANTIATION: The existing wording could lead one to apply a great demand value resulting in a lower feeder ampacity and rating.
PANEL ACTION: Accept in Principle.
Change title to read "Allowable Demand Factors".
PANEL STATEMENT: This text would be consistent with other demand factor tables, including 550-2.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #948)

19- 56 - (Table 550-22): Accept in Principle
Note: The Technical Correlating Committee understands that the action on this proposal further modifies the action on Proposal 19-37.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise heading:
Demand Factors for Feeders and Services ~~Entrance Conductors.~~
SUBSTANTIATION: Editorial. The first paragraph appears to relate to park site wiring systems. The second paragraph appears to cover park sites and mobile home feeders supplied from a common mobile home service which is not explicitly prohibited. This could permit, for example, a 100-ampere service to supply two mobile home feeders which does not seem to be the intent.
"Service-entrance" conductors excludes application of demand factors for service-lateral and service-drop conductors. The second paragraph allows Section 310-15(b)(6) to apply to such conductors as the word "service" applies to these conductors. Section 555-6 uses the encompassing word "service".
PANEL ACTION: Accept in Principle.
Revise heading text for the table to read as follows:
"Demand Factors for Services and Feeders"
PANEL STATEMENT: The revised language would be consistent with 310-15(b)(6) and Table 310-15(b)(6).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #306)

19- 57 - (550-23): Reject
SUBMITTER: Curtis Patterson, Christenson Electric, Inc.
RECOMMENDATION: As you can see from the diagram I have provided, the home in question is the only one on approximately 10 acres. It is connected to concrete runners and has a block foundation. If this were a stick built home it would not need the additional 200 amp disconnect on the outside of the home, but because it is a manufactured home, according to NEC 550-23 and the local inspector the disconnect is necessary.
My proposal is that wording be inserted to exclude manufactured homes in this situation from this article. Perhaps the words could state:
"If the home is the only one at this address and has a remote service on the premises and a service rated panel in the premises then it shall be exempted from 550-23."
Please word the exception, as you see fit, but this is my intent.
SUBSTANTIATION: It appears to me that 550-23 was written in reference to manufactured homes in a trailer park type setting. In this area, there are getting to be more and more of these manufactured homes on acreage, not in a park type setting.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: There is no specific proposal stated in the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

(Log #4055)

19- 65 - (550-23(d)): Reject
SUBMITTER: David P. Brown, Baltimore Gas and Electric Co./Rep. Edison Electric Inst./Electric Light & Power Group
RECOMMENDATION: Change to read as follows:
550-23(d) Additional Outside Electrical Equipment. Either mobile ~~Mobile~~ home service equipment or the external disconnecting means permitted in Section 550-23(a) shall be permitted to ~~also~~ contain a means for connecting a mobile home accessory building or structure, or additional electrical equipment located outside a mobile home by a fixed wiring method.
SUBSTANTIATION: Section 550-23(d) requires the "service equipment" to provide a means for connecting a mobile home accessory building or structure, or additional electrical equipment located outside a mobile home, however Section 550-23(a) permits the service equipment to be located elsewhere on the premises, provided that a disconnecting means suitable for service equipment is located in sight from and not more than 30 ft (9.14 m) from the exterior wall of the mobile home it serves. When this occurs, it is believed that it is acceptable to make provisions for the connection of equipment external to the mobile home as part of the disconnect installation. This additional disconnect may be suitable as service equipment but it is not the service equipment and it is being supplied by a feeder not a service.
This problem becomes very apparent in the 1999 NEC when the mobile home is served via meter packs that include tenant breakers. This type of installation is very common, however in this case the meter pack becomes the service equipment, but has no possible provision for any additional circuits as required in 550-23(d). Therefore meter packs with tenant breakers in mobile home parks would violate the 1999 NEC. In the 1996 NEC it was permitted to install "fuses and disconnecting means or circuit breakers" on the supply side of a service disconnect via Section 230-82, Exception No. 2. This allowed the serving utility to feed the mobile home service equipment from a meter pack, however this exception was eliminated in the 1999 NEC.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing Code allows what is requested in the recommendation.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #2783)

19- 67 - (550-24(a) Exception No. 2 (New)): Reject
SUBMITTER: Daniel L. Robertus, State of Montana Electrical Insp. Dept.
RECOMMENDATION: Add an exception to read as follows:
Exception No. 2: Where a feeder is installed to a manufactured home distribution panelboard from service equipment installed on the manufactured home meeting the requirements of 550-23(b), the feeder shall be permitted to be any approved wiring method described in Chapter 3.
SUBSTANTIATION: Where manufactured homes are now built to similar standards as site built housing and generally do not have exterior metallic coverings, the hazards which formed the requirement for the insulated equipment ground are not any greater than those in a standard site built home. With the installation of the service on the exterior of the manufactured home, SER cable appears to be a wiring method that many installers would like to utilize. The uninsulated equipment ground in SER cable makes its use a code violation at this time.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation would create a conflict with the existing federal installation standards.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #951)

19- 68 - (550-24(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Adequate ~~Feeder~~ Capacity. Mobile home lot feeder and service conductors supplying the mobile home service equipment and the disconnecting means permitted by Section 550-23(a) shall have adequate capacity for the loads supplied and shall be rated not less than 100-amperes at 120/240 volts. Conductors in compliance with Section 310-15(b)(6) shall be permitted.
SUBSTANTIATION: Service conductors and the conductors from the service equipment to the disconnect permitted in Section 550-23(a) should be included. The reference to Section 310-15(b)(6) is suggested as the feeder conductors in the last paragraph of Section 550-22 are not the mobile home lot supply conductors, and "rated" may be equated with ampacity.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal deals with service not feeders and would make the existing requirement more difficult to understand.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
COMMENT ON AFFIRMATIVE:
BAUMAN: The Panel Statement is inverted. The Panel Statement should say that the section refers to feeders, not services.

(Log #2848)

19- 69 - (550-25): Accept in Principle in Part

Note: The Technical Correlating Committee understands that the action on this proposal further modifies the action on Proposal 19-37.

SUBMITTER: Robert J. Clarey, Cutler-Hammer, Inc.

RECOMMENDATION: Revise text as follows:

Arc-Fault Circuit-Interrupter Protection

(a) Definition. Arc-Fault Circuit-Interrupters are defined in 210-12(a).

(b) Bedrooms and living areas of mobile homes and manufactured homes. All branch circuits that supply 125-volt single-phase, 15- and 20-ampere outlets installed in bedrooms and living areas of mobile homes and manufactured homes shall be protected by arc-fault circuit interrupter(s).

FPN: A mobile home or manufactured home living area is any space,that can be normally occupied, other than bedrooms, bathrooms, toilet compartments, kitchens, closets, halls, storage, garage or utility spaces.

SUBSTANTIATION: The 1999 National Electrical Code mandates the use of Arc-Fault Circuit Protection for all branch circuits that supply 125-volt single phase 15- and 20-ampere receptacle outlets installed in dwelling unit bedrooms (see 210-12(b)). Through the detection and interruption of arcing faults, these branch/feeder AFCIs, located at the source of the branch or feeder, provide additional protection against fires associated with electrical arcing in the installed wiring and beyond. Proposals for the 2002 National Electrical Code will seek to expand this AFCI protection to the circuits supplying the outlets of dwelling unit bedrooms and living areas. In particular, the present proposal is aimed at extending branch/feeder AFCI protection to the circuits supplying the bedroom and living area outlets of mobile homes and manufactured homes.

The impetus for this Code change is to reduce the number of electrically-related fires in mobile homes and manufactured homes, with their associated death toll, injury toll and property damage. The 1998 U.S. Consumer Product Safety Commission report (1) entitled "1996 Residential Fire Loss Estimates" provides estimates of the fire losses, in residential structures, for the total electrical distribution system. For 1996 the estimate is 41600 fires, 370 civilian deaths, 1430 civilian injuries, and $682.5M in property losses. This CPSC report does not delineate Mobile Homes and Manufactured Homes within the overall category of Residences. However, a 1999 Federal Emergency Management Agency publication (2), entitled "Fire in the United States 1987-1996", states that "Manufactured housing, separated from the dwelling category, has a much greater share of fire deaths (11%) relative to its share of fires (4%). Deaths per fire are approximately twice as high for manufactured housing as for other dwellings". Although this FEMA report does not separate out the fires of electrical origin, it will be apparent that reductions in the number of fires will reduce the overall death toll. We can all relate to tragic cases of fires, of electrical origin, within such homes. As with residences in general, such fires can frequently be related to accidental wiring abuses and neglect.

An explanation of AFCIs is given in the 1997 IAEI paper (3) (copy provided). When used in conjunction with circuit breakers, these devices provide additional fire protection. Conventional circuit breakers are equipped with bimetal-elements and magnetic trip elements, and they protect the circuit wiring by responding to overcurrents. During low-current overloads, heating of the bimetal causes the breaker to unlatch the contact-separation mechanism. For high overcurrent conditions, the associated high magnetic fields cause "instantaneous tripping" of the circuit breaker. However, these thermal-magnetic circuit breakers are not specifically designed to respond to arcing faults. By contrast, AFCIs are designed to detect and interrupt the sputtering (intermittent) arcs associated with arcing faults. These devices have the ability to distinguish the waveshapes of these intermittent arcs from the transient inrush currents associated with motors, ballasts, and electronic equipment. In particular, AFCIs can interrupt arc-fault currents even though the rms current of the intermittent fault is below the handle rating of the circuit breaker.

During the previous Code cycle, the subject of AFCIs was discussed in depth, within Code Making Panel 2. At that time there were concerns with the newness of the technology. In the ensuing years, however, significant events have occurred that provide additional confidence in the availability and value of branch/feeder AFCIs. These are: First, in February 1999, Underwriters Laboratories published the first Edition of UL 1699 "Arc-Fault Circuit-Interrupters". The branch/feeder AFCIs described in that document are substantially identical to the "AFCIs classified for mitigating the effects of arcing faults" that were available during the 1999 Code cycle, and that were previously described in a draft standard. The branch/feeder AFCIs described in UL 1699 protect the installed wiring, and also provide protection against line to neutral and line to ground arcing faults in the cords connected to the outlets. The existence of this standard, and of the associated branch/feeder products, indicates that the products have matured. Second, many circuit breaker manufacturers now offer combination circuit breakers and branch/feeder AFCIs. Thus, AFCI devices are readily available. Third, Manufacturers have gained hundreds of millions of operating-hours experience with AFCIs. The consumers have benefited from the enhanced arcing fault protection. Further, consumers have not experienced "nuisance tripping" due to the false identification of circuit waveforms such as the inrush transients to motors, and the normally occurring arcing waveforms associated with devices such as thermostats, motors, and switches. Fourth, AFCI manufacturers have made numerous AFCI presentations to fire inspectors, electrical inspectors, and other groups concerned with public safety. This has raised awareness of both the technology and the associated safety potential, and the overwhelming response has been both positive and enthusiastic. Fifth, in 1999 the Consumer Product Safety Commission has made a brief report (4) entitled "Preventing Home Fires: Arc Fault Circuit Interrupters (AFCIs)". This report includes the statement, "Several years ago, a CPSC study identified arc fault detection as a promising new technology. Since then, CPSC electrical engineers have tested the new AFCIs on the market and found these products to be effective". Thus, AFCIs have moved from the conceptual stage, as discussed in the 1995 UL Report for CPSC "Technology for Detecting and Monitoring Conditions that Could Cause Electrical Wiring System Fires" to the practical stage. In particular, they are available on the market and are effective.

As with other types of residences, mobile homes and manufactured homes suffer the consequence of fires of electrical origin within the total electrical distribution system. For all residences, such electrical fires represent about 10% of all residential fires. This 10% number still represents the tragic loss of 370 lives, severe injuries, and huge property losses. The presence of presently available AFCIs at the origin of the branch circuit will result in enhanced safety through the detection and interruption of arcing events within the installed wiring. These branch/feeder AFCIs will also detect and interrupt line to neutral and line to ground faults in the cords connected to the outlets. The technology is available, the technology is effective, the technology has been included in the Code for dwelling units, and the Code Panel is now urged to accept this proposal which would apply the fire-safety-benefits of AFCIs to mobile homes and manufactured houses.

PANEL ACTION: Accept in Principle in Part.

Revise text as follows:

"Arc-Fault Circuit-Interrupter Protection

(a) Definition. Arc-Fault Circuit-Interrupters are defined in 210-12(a).

(b) Bedrooms of mobile homes and manufactured homes. All branch circuits that supply 125-volt single-phase, 15- and 20-ampere outlets installed in bedrooms of mobile homes and manufactured homes shall be protected by arc-fault circuit interrupter(s)."

PANEL STATEMENT: The part of the recommendation that dealt with other living areas was deleted from the recommendation until more field experience with other locations can be obtained.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

MCCULLOUGH: I vote to reject this proposal. While not arguing the pros and cons of AFCIs, I believe that this requirement should not be included in the NEC unless or until this issue is acted upon by the NFPA 501 committee. The Panel Action on

Proposal 19-37 was to improve and ensure consistency between the NEC and NFPA 501 and acceptance of this proposal puts the two documents at odds.

WEAKLEY: The proposal concerns AFCIs in a manufactured home. The manufactured home industries' argument is that if it is not specific to the article then compliance would not be required. The consensus was that enforcement/compliance is for standards that are specific to their article (550) (by reference it is secific). The language that exists makes clear reference to other articles that are applicable. My position is, the code book is large enough, and that redundant text is not necessary. I also felt that it was a product that would eventually be an integral part of all circuit breakers, and that by reference is covered in other articles.

ARTICLE 551 — RECREATIONAL VEHICLES AND RECREATIONAL VEHICLE PARKS

(Log #521)

19- 70 - (551): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: 1. In Section 551-2. Definitions. Frame., replace "16 MSG" with "1.35 mm (0.053 in.)".

2. In Section 551-2. Definitions. Travel Trailer., replace "320 ft^2 (29.7 m^2)" with "30 m^2 (320 ft^2)".

3. In Section 551-10(b)(4), replace "4 ft (1.22 m)" with "1.2 m (4 ft)".

4. In Section 551-10(b)(5), replace "18 in. (457.2 mm)" with "450 mm (18 in.)".

5. In Section 551-10(c)(3), replace "1/2-in. (12.7 mm)" with "13 mm (1/2-in.)".

6. In Section 551-10(d), replace "1.7 in^2 (1100 mm^2)" with "1100 mm^2 (1.7 in^2)" and replace "2 in. (50.8 mm)" with "50 mm (2 in.)".

7. In Section 551-10(e)(4) and its Exception, replace "18 in. (457 mm)" with "450 mm (18 in.)" throughout.

8. In Section 551-30(e), replace "18 in. (457 mm)" with "450 mm (18 in.)" throughout.

9 . In Section 551-41(a), replace "2 ft (610 mm)" with "600 mm (2 ft)" and replace "6 ft (1.83 m)" with "1.8 m (6 ft)".

10. In Section 551-41(b)(1), replace "12 in. (305 mm)" with "300 mm (12 in.)".

11. In Section 551-41(b)(3), replace "12 in. (305 mm)" with "300 mm (12 in.)" and replace "6 ft (1.83 m)" with "1.8 m (6 ft)".

12. In Section 551-41(c)(2) and its Exception No. 3, replace "6 ft (1.83 m)" with "1.8 m (6 ft)" throughout.

13. In Section 551-43(b), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".

14. In Section 551-45(b), replace "24 in. (610 mm)" with "600 mm (24 in.)" and replace "30 in. (762 mm)" with "750 mm (30 in.)".

15. In Section 551-45(b) Exception No. 1, replace "22 in. (559 mm)" with "550 mm (22 in.)" and replace "2 in. (50.8 mm)" with "50 mm (2 in.)".

16. In Section 551-46(b), replace "23 ft (7.0 m)" with "7.0 m (23 ft)"; "28 ft (8.5 m)" with "8.5 m (28 ft)"; and "3 ft (0.9 m)" with "900 mm (3 ft)" throughout.

17. In Section 551-46(d), replace "3 in. (76 mm)" with "75 mm (3 in.)"; "1 3/4 in. (44.5 mm)" with "45 mm (1 3/4 in.)"; "0.020-in. (508-µm)" with "0.51 mm (0.020 in.)"; and "0.005-in. (127-µm)" with "0.13 mm (0.005 in.)".

18. In Section 551-46(e), replace "15 ft (4.57 m)" with "4.5 m (15 ft)" and replace "18 in. (457 mm)" with "450 mm (18 in.)".

19. In Section 551-46(e) Exception No. 2, replace "15 ft (4.57 m)" with "4.5 m (15 ft)" throughout.

20. In Section 551-47(e) Exception No. 2, replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)" and replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".

21. In Section 551-47(g), replace "2 in. by 4 in." with "2-by-4"; "2 in. by 2 in." with "2-by-2"; "1 1/4 in. (31.8 mm)" with "32 mm (1 1/4 in.)"; and "No. 16 MSG" with "1.35 mm (0.053 in.)".

22. In Section 551-47(i), replace "12 in. (305 mm)" with "300 mm (12 in.)" and replace "4 1/2 ft (1.37 mm)" with "1.4 m (4 1/2 ft)".

23. In Section 551-47(j), replace "8 in. (203 mm)" with "200 mm (8 in.)".

24. In Section 551-47(l), replace "0.030 in. (762 µm)" with "0.76 mm (0.030 in.)" and replace "0.040 in. (1.016 mm)" with "1.0 mm (0.040 in.)".

25. In Section 551-77(a), replace "9 ft (2.74 m), +1 ft (0.3 m)" with "2.7 m + 0.3 m (9 ft + 1 ft)"; "15 ft (4.57 m)" with "4.5 m (15 ft)"; "16 ft (4.88 m)" with "4.9 m (16 ft)"; and "32 ft (9.75 m)" with "10 m (32 ft)".

26. In Sections 551-77(c) and (d), replace "2 ft (610 mm)" with "600 mm (2 ft)" and replace "6 1/2 ft (1.98 m)" with "2.0 m (6 1/2 ft)" throughout.

27. In Section 551-79, replace "18 ft (5.49 m)" with "5.5 m (18 ft)" and replace "3 ft (914 mm)" with "900 mm (3 ft)".

28. In Section 551-80(b), replace "18 in. (457 mm)" with "450 mm (18 in.)".

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following. In Items 1 and 21, No. 16 MSG is considered to represent a nominal metal thickness, corresponding to a thickness value not commonly known or available to the users of the NEC. The equivalent nominal decimal thickness is 0.060 in., based on material standards and handbooks. However, since this value is nominal, a tolerance must be applied to achieve a minimum allowable thickness. The accepted industry practice is to apply a minus tolerance of 0.007 in. for 16 MSG, resulting in a minimum thickness of 0.053 in. (1.35 mm). The SI units and inch-pound numbers in parenthesis are not shown for Item 21's stud sizes since they are not a direct conversion and a Trade Size is provided.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #1090)

19- 71 - (551): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise Article 551 as follows:

551-10(b)(2) - change "No. 6 through No. 18" to "6 through 18 AWG"

551-10(c)(5) - change "No. 8" to "8 AWG" in two places

551-20(c) - change "No. 8" to "8 AWG"

551-43(b) - change "No. 14" to "14 AWG"

551-56(c) - change "No. 8" to "8 AWG".

SUBSTANTIATION: To provide consistency throughout the Code The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

PANEL STATEMENT: The NEC Style of Manual does not specify the language used one way or another. The NFPA Manual of Style seems to prefer 10 AWG. Product standards use 10 AWG or 10 AWG 110-6 says that the conductor sizes are expressed in AWG or in circular mils so the AWG is implied The panel recognizes that the TCC may desire to take a different action to be consistent with the Code.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #425)

19- 72 - (551-2-Disconnecting Means): Reject

SUBMITTER: William J. Miller, Newmar Corp.

RECOMMENDATION: Revise definition of Disconnecting Means to read as follows:

Disconnecting Means. The necessary equipment usually consisting of a circuit breaker or fuses, and their accessories, <u>or plug and receptacle,</u> ~~located near the point of entrance of the supply conductors in~~ <u>on</u> a recreational vehicle and intended to constitute the means of cutoff for the supply to that recreational vehicle.

SUBSTANTIATION: Section 551-30(b), second paragraph states that "Receptacles used as a disconnecting means shall be" etc.. — therefore, the definition should include plug and receptacle as a disconnecting means. These plugs and receptacles for disconnecting the generator may be the same plug that is at the end of the power supply that is required on all recreation vehicles per 551-46. If that is the disconnecting means for the generator, it would follow that it is the disconnecting means for the power

supply to the recreational vehicle. The location of that disconnecting means becomes irrelevant since all units have the cord and plug arrangement at the entrance of the power supply. The cord is part of the recreation vehicle.
PANEL ACTION: Reject.
PANEL STATEMENT: Existing 551-45(c) and 551-77(b) conflict with this recommendation because the use of a plug and receptacle is not permitted. The recommendation would encourage the use of a plug and receptacle to be the disconnecting means.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1396)

19- 73 - (551-2-Recreational Vehicle Site): Accept
Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: Revise to read:
Recreational Vehicle Site. A plot of ground within a recreational vehicle park set aside for the accommodation of a recreational vehicle on a temporary basis. It can be used as either a recreational vehicle site or as a camping unit site.
SUBSTANTIATION: NFPA has developed a glossary of standard terms that are used in all of its codes and standards. One of the goals of the glossary project is to provide a single consistent definition for each term that can be used in each code or standard in which the term is used. In this instance, the preferred definition can be found in NFPA 501D.
PANEL ACTION: Accept.
PANEL STATEMENT: The panel recognizes that 501D is now NFPA 1194.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
GORIN: Section 1-3 of the 1999 Edition of ANSI A119.4/NFPA 1194 eliminates the definition of a "Recreational Vehicle Site" and substitutes the term "Camping Unit Site" for all sites within an RV park of campground.

(Log #2260)

19- 74 - (551-10): Accept in Principle
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Revise text as follows:
551-10. Low-Voltage Systems
(a) Low-Voltage Circuits. Low-voltage circuits furnished and installed by the recreational vehicle manufacturer, other than automotive vehicle circuits or extensions thereof, are subject to this Code. Circuits supplying lights subject to federal or state regulations shall comply with applicable government regulations and this Code.
(b) Low-Voltage Wiring.
~~1.~~ (1) Material. Copper conductors shall be used for low-voltage circuits.
Exception: Metal chassis or frame shall be permitted as the return path to the source of supply.
~~2.~~ (2) Conductor Types. Conductors shall conform to the requirements for Type GXL, HDT, SGT, SGR, or Type SXL or shall have insulation in accordance with Table 310-13 or the equivalent. Conductor sizes No. 6 through No. 18 or SAE shall be listed. Single-wire, low-voltage conductors shall be of the stranded type.
FPN: See SAE Standard J1128-1995 for Types GXL, HDT, and SXL and SAE Standard J1127-1995 for Types SGT and SGR.
~~3. Single-wire, low-voltage conductors shall be of the stranded type.~~
~~4.~~ (3) Marking. All insulated low-voltage conductors shall be surface marked at intervals not greater than 4 ft (1.22 m) as follows.
~~a.~~ (1) Listed conductors shall be marked as required by the listing agency.
~~b.~~ (2) SAE conductors shall be marked with the name or logo of the manufacturer, specification designation, and wire gauge.
~~c.~~ (3) Other conductors shall be marked with the name or logo of the manufacturer, temperature rating, wire gauge, conductor material, and insulation thickness.
~~5.~~ (4) Insulation Rating. Conductors shall have a minimum insulation rating of 90°C (194°F) for interior installations and 125°C (257°F) for all engine compartment wiring or any under-chassis installations where conductors are located less than 18 in. (457.2 mm) from any component of an internal combustion engine exhaust system.
(c) Low-Voltage Wiring Methods.
~~1.~~ (1) Physical Protection. Conductors shall be protected against physical damage and shall be secured. Where insulated conductors are clamped to the structure, the conductor insulation shall be supplemented by an additional wrap or layer of equivalent material, except that jacketed cables shall not be required to be so protected. Wiring shall be routed away from sharp edges, moving parts, or heat sources.
~~2.~~ (2) Splices. Conductors shall be spliced or joined with splicing devices that provide a secure connection or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices shall first be spliced or joined so as to be mechanically and electrically secure without solder and then soldered. All splices, joints, and free ends of conductors shall be covered with an insulation equivalent to that on the conductors.
~~3.~~ (3) Separation. Battery and dc circuits shall be physically separated by at least a 1/2-in. (12.7-mm) gap or other approved means from circuits of a different power source. Acceptable methods shall be by clamping, routing, or equivalent means that ensure permanent total separation. Where circuits of different power sources cross, the external jacket of the nonmetallic-sheathed cables shall be deemed adequate separation.
~~4.~~ (4) Ground Connections. Ground connections to the chassis or frame shall be made in an accessible location and shall be mechanically secure. Ground connections shall be by means of copper conductors and copper or copper-alloy terminals of the solderless type identified for the size of wire used. The surface on which ground terminals make contact shall be cleaned and be free from oxide or paint or shall be electrically connected through the use of a cadmium, tin, or zinc-plated internal/external-toothed lockwasher or locking terminals. Ground terminal attaching screws, rivets or bolts, nuts, and lockwashers shall be cadmium, tin, or zinc-plated except rivets shall be permitted to be unanodized aluminum where attaching to aluminum structures.
~~5.~~ The chassis-grounding terminal of the battery shall be bonded to the vehicle chassis with a minimum No. 8 copper conductor. In the event the power lead from the battery exceeds No. 8, then the bonding conductor shall be of an equal size.
(d) Battery Installations. Storage batteries subject to the provisions of this Code shall be securely attached to the vehicle and installed in an area vaportight to the interior and ventilated directly to the exterior of the vehicle. Where batteries are installed in a compartment, the compartment shall be ventilated with openings having a minimum area of 1.7 in.^{2} (1100 mm^2) at both the top and at the bottom. Where compartment doors are equipped for ventilation, the openings shall be within 2 in. (50.8 mm) of the top and bottom. Batteries shall not be installed in a compartment containing spark- or flame-producing equipment, except that they shall be permitted to be installed in the engine generator compartment if the only charging source is from the engine generator.
(e) Overcurrent Protection.
~~1.~~ (1) Wiring. Low-voltage circuit wiring shall be protected by overcurrent protective devices rated not in excess of the ampacity of copper conductors, ~~as follows.~~ in accordance with Table 551-10(E)(1).
Table 551-10(e)(1). Low-Voltage Overcurrent Protection
[Insert Table 551-10(e)(1) from 1999 NEC here]
~~2.~~ (2) Type. Circuit breakers or fuses shall be of an approved type, including automotive types. Fuseholders shall be clearly marked with maximum fuse size, and both circuit breakers and fuses shall be protected against shorting and physical damage by a cover or equivalent means.
FPN: For further information, see Standard for Electric Fuses (Cartridge Type), ANSI/SAE J554-1987; Standard for Blade Type Electric Fuses, SAE J1284-1988; and Standard for Automotive Glass Tube Fuses, UL 275-1993.
~~3.~~ (3) Appliances. Higher current-consuming, dc appliances, such as pumps, compressors, heater blowers, and similar motor-driven appliances, shall be installed in accordance with the manufacturer's instructions.

Motors that are controlled by automatic switching or by latching-type manual switches shall be protected in accordance with Section 430-32(c).

~~4.~~ (4) Location. The overcurrent protective device shall be installed in an accessible location on the vehicle within 18 in. (457 mm) of the point where the power supply connects to the vehicle circuits. If located outside the recreational vehicle, the device shall be protected against weather and physical damage.

Exception: External low-voltage supply shall be permitted to have the overcurrent protective device within 18 in. (457 mm) after entering the vehicle or after leaving a metal raceway.

(f) Switches. Switches shall have a dc rating not less than the connected load.

(g) Lighting Fixtures. All low-voltage interior lighting fixtures rated more than 4 watts, employing lamps rated more than 1.2 watts, shall be listed.

(h) Cigarette Lighter Receptacles. Twelve-volt receptacles that will accept and energize cigarette lighters shall be installed in a noncombustible outlet box, or the assembly shall be identified by the manufacturer of the product as thermally protected.

SUBSTANTIATION: Changes add titles and use new layout in accordance with the new Style Manual. Existing 551-10(b)(3) is incorporated as new last sentence of (b)(2) as more appropriate placement, remaining levels renumbered accordingly. Existing 551-10(c)(5) is incorporated as last sentence of (c)(4). 550-10(e)(1) is revised to include specific reference to Table 551-10(e)(1) rather than using the wording "as follows."

PANEL ACTION: Accept in Principle.

Revise text in title of Section (e)(1) from "wiring" to "rating".

PANEL STATEMENT: This terminology is more accurate.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #3636)

19- 75 - (551-10(a) through (h)): Reject

SUBMITTER: Kent Perkins, Recreational Vehicle Industry Assn.

RECOMMENDATION: Delete 551-10(a) through (h).

SUBSTANTIATION: The substantiation from 1999 ROP Log #2752 still applies. The adoption of ANSI 12V for use with RV and CV low voltage systems by all jurisdictions is anticipated and this section of the NEC should be deleted.

The substantiation of Log #2752 states:

"The ever increasing pace of automotive technology changes and the rapid advances in the capabilities of basic materials and derived systems have often led to conflicts of the current provisions for 12 v DC construction and the needs of the recreational vehicle products. The National Electrical Code has basically addressed 120/240 volt AC needs for all construction and through the provisions of Article 551 addressed the special needs of recreational vehicles. Paragraph 90-2(b)(1) states that similar products using low voltage systems such as watercraft, aircraft, and automotive vehicles (other than mobile homes and recreational vehicles) are not covered by the present Code. Article 551 Part B paragraph 551-10 Low Voltage Systems falls short of today's need to address integration of the automotive designs and the recreational vehicle's historic 12 v systems."

In addition, while CMP-19 agreed in concept with the substantiation during the 1999 NEC revision process, they were concerned no other low voltage requirements exist. The ANSI/RVIA 12V for conversion vehicles and recreational vehicles is currently under letter ballot for gaining ANSI recognition. Several CMP-19 members are participants on the canvas list who are responsible for the approval process of this standard.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no adequate standard in place to replace the existing low voltage requirements.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

COMMENT ON AFFIRMATIVE:

ZIEMAN: I do not agree with the Submitter's statement that "Code-Making Panel 19 agreed in concept with the substantiation during the 1999 NEC revision process."

The submitter has failed to substantiate the need for going to an outside standard (ANSI/RVIA 12V Low Voltage...) instead of revising and updating the low voltage requirements currently with Section 551-10.

(Log #953)

19- 76 - (551-10(c)(1)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Add new text to read as follows:

Conductors shall be continuous without splice between boxes, other enclosures, and equipment. Conductors installed through holes, in notches, or parallel to framing members shall comply with applicable requirements of Section 300-4. Where conductors without a metal sheath or armor, or installed in electrical nonmetallic tubing or liquidtight flexible nonmetallic conduit, pass through punched, cut, or drilled holes in metal members, they shall be protected by bushings or grommets securely fastened in the opening prior to installation of the conductors.

SUBSTANTIATION: Splices should be limited to accessible points. The proposal provides specifics to complement the general requirement of the first sentence, as is done in Section 551-47(g) for 120-volt systems to augment general requirement of Section 300-4.

PANEL ACTION: Reject.

PANEL STATEMENT: No safety data has been submitted to support the recommendation.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #954)

19- 77 - (551-10(e)(3), (f)): Accept in Part

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(e) (3) ~~Higher current consuming, direct current appliances~~ Appliances such as pumps, compressors, heater blowers, and similar motor-driven appliances, shall be installed in accordance with the manufacturers instructions.

Motors that are controlled by automatic switching or latching type manual switches shall be protected in accordance with Section 430-32(c).

(f) Switches. Switches shall have a suitable ~~direct~~ current rating not less than the connected load.

SUBSTANTIATION: Editorial. In a technical sense appliances don't "consume" current. "Higher current" is not defined and requires subjective judgment. Shouldn't all appliances be installed per manufacturers instructions? The delete phrases do not adversely affect the rule. The definition of low-voltage in Section 551-2 does not limit these systems to dc. While dc is prevalent (or exclusive) ac is not excluded. The panel previously stated they do not intend to exclude ac systems. (Proposal 19-50 in the 1995 ROP.)

PANEL ACTION: Accept in Part.

The panel accepts the deletion of "Higher current consuming" in the first line of the recommendation.

PANEL STATEMENT: The existing language clearly specifies dc appliances and does not need further clarification. The dc switches require a dc rating.

(Log #3635)

19- 78 - (551-10(g)): Accept in Principle

SUBMITTER: Kent Perkins, Recreational Vehicle Industry Assn.

RECOMMENDATION: Add as a second paragraph to read as follows:

"Ceiling fixtures in camping trailers shall be automatically deenergized by an interlock when folding down the trailer or it shall be physically impossible to fold down the trailer unless the ceiling fixture(s) are disconnected."

SUBSTANTIATION: This requirement harmonizes the NEC standard with the Canadian Standards Association (CSA) RV Standard, 1999 - Z240, paragraph 4.12.8, which reads as follows:

"Ceiling fixture(s) in tent trailers shall be automatically deenergized by an interlock when "folding down" the trailer or it shall be physically impossible to "fold down" the trailer unless the ceiling fixture(s) is (are) disconnected."

PANEL ACTION: Accept in Principle.

Change "fixture" to "luminaire" in the recommendation.

PANEL STATEMENT: See recommendation in Proposal in 19-1.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #2802)

19- 79 - (551-20(b), Exception): Accept in Principle
SUBMITTER: Terry Current, Jayco, Inc.
RECOMMENDATION: Change exception to second paragraph to read as follows:
Exception: A low-voltage appliance that is controlled by a momentary switch (normally open) that has no means for holding in the closed position or refrigerators with 120-volt function priority over 12-volt function shall not be considered as a connected load when determining the required converter rating. Momentarily energized appliances shall be limited to those used to prepare the vehicle for occupancy or travel.
SUBSTANTIATION: The refrigerator manufacturer guidelines are the 120-volt operation is the most efficient and first recommended mode of operation with LP-gas being second and 12-volt third typically to be used during travel and/or refueling. Accordingly, the 12-volt mode of operation is not likely used when 120-volt is available. The LP-Gas mode is used in the event 120-volt power is not available. The power supply selection is further supported by the defaults to the energy source of the refrigerators with automatic mode selection features as the supply is selected in the order of the most efficient preferred mode.
The proposal harmonizes NFPA 70 National Electrical Code with CAN/CSA-Z240 4.10(3) that has been in effect since at leas 1982 without adverse effect to vehicle performance or compromise of safety, and allows additional design flexibility.
PANEL ACTION: Accept in Principle.
Revise recommendation as follows:
"or refrigerators with an automatic 120-volt function priority over 12-volt function"
PANEL STATEMENT: The addition of the term automatic would ensure safe operation.

(Log #1498)

19- 80 - (551-20(c)): Reject
SUBMITTER: Bill Wallace, Magnetek Inc.
RECOMMENDATION: Revise text as follows:
~~(The grounding conductor for the battery and metal enclosure shall be permitted to be the same conductor.)~~ The unit should be provided with a separate chassis bonding lead and shall not be used in combination with any current carrying conductor.
SUBSTANTIATION: The intent of this paragraph is to prevent 12-volt fault currents from finding their way back to the vehicle frame over the ac grounding conductor of the converter. In the case of a bad connection between the battery bonding conductor required by 551-10(c)(5) and the vehicle frame, current does flow back through the converter power supply cord.
Note: Supporting material available for review at NFPA Headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation was not supported by the drawings. The safety problem was not clearly explained in the substantiation. The recommendation contains nonmandatory language (should).

19- 81 - (551-41(e) (New)): Reject
SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Add new text to read as follows:
(e) All receptacles shall be of the back-wired or screw-terminal type. No receptacles shall be permitted to be installed using only the push-in connection.
SUBSTANTIATION: Receptacles wired with solid wire using push-in type connections are not suitable for use in recreational vehicles.
Stranded wire should be required for all wiring in recreational vehicles, as solid wire breaks from the vibration and shaking of the wires during the motion of the vehicle. Solid wire is not suitable for use in recreational vehicles.
I have had to replace all of the receptacles in my nine year old travel trailer because of overheating at the receptacle where the solid wire has been pushed into the receptacle.
Connections to receptacles should only be made using either terminal screw or back-wired methods. Both which work well with stranded wire. Stranded wire does not make an acceptable electrical connection with push-in type terminals.
PANEL ACTION: Reject.
PANEL STATEMENT: This issue has historically not been a problem and the submitter has not supplied data to substantiate the recomendation on push-in connections.

(Log #625)

19- 83 - (551-44): Accept in Principle
SUBMITTER: James W. Finch, Kampgrounds of America, Inc. (KOA)
RECOMMENDATION: Revise 551-44 to read as follows:
551-44. Power Supply Assembly. Each recreational vehicle should have one and only one of the following Main Power-Supply Assemblies.
SUBSTANTIATION: There are recreational vehicles being built that are utilizing more than one power supply assembly. In addition, there are adapters (cheaters) being made that plug into both the 30-amp receptacle and the 20-amp receptacle at the campgrounds site service equipment and accept a 50-amp plug from the recreational vehicle. If more than one power assembly is allowed on a RV, it will compromise the site service in the same way that the adapter does.
Historically, there have been multiple receptacles in site service equipment on campgrounds to facilitate convenience and, more importantly, safety. The intention was to eliminate the need for adapters to use the site service equipment. Their intent was not for additional power. Please refer to the last sentence in 551-73(a). "Where the electrical supply for a recreational vehicle site has more than one receptacle, the calculated load shall only be computed for the highest rated receptacle." This statement was added to the 1996 National Electrical Code, the same code cycle that eliminated Exception No. 1 from 551-43 which allowed a second power cord. This was done to eliminate the problems that two power cords create.
If you consider vehicle site supply equipment site services, then Section 230-2 applies. "A building or other structure served shall be supplied by only one service unless permitted in (a) through (d)." The only situation in (a) through (d) that could apply is (c)(2) "Additional service shall be permitted where the load requirements of a single-phase installation are greater than the serving agency

normally supplies through one service." I do not consider this situation applicable because campgrounds' site supply equipment has not been designed to provide electrical service from all of the receptacles in the site equipment since the calculated load is only for the highest rated receptacle. (re: 551-73)

If the RV manufacturers need more power to their unit than 50-amps/240 volts, they need to propose an additional power supply assembly designed for these units. They should not overload the hundreds of thousands of site services that are already in the field.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle.

Revise 551-44 to read as follows:

"551-44. Power Supply Assembly. Each recreational vehicle shall have only one of the following Main Power-Supply Assemblies."

PANEL STATEMENT: Should is not enforceable language and the other deleted text was superfluous.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #626)

19- 85 - (551-46): Accept

Note: The Technical Correlating Committee directs that this Proposal be referred to the Technical Correlating Committee Metrication Task Group for comment.

SUBMITTER: James W. Finch, Kampgrounds of America, Inc. (KOA)

RECOMMENDATION: Revise 551-46 to read as follows:

The cord exposed usable length, measured to the point of entry on the vehicle exterior, shall be a minimum of ~~23 ft (7.0 m)~~ 25 ft (7.62 m) where the point of entrance is at the side of the vehicle, or shall be a minimum ~~28 ft (8.5 m)~~ 30 ft (9.15 m) where the point of entrance is at the rear of the vehicle.

SUBSTANTIATION: It has been proposed in 551-77 that the site supply equipment shall be moved 2 ft (0.6 m) further away from the left edge of the site stand to give adequate clearance for RV expandable room sections and for the tail swing of large RVs with up to a 15 ft (4.57 m) overhang. If this proposal is accepted, then it would logically follow that the cord needs to be 2 ft (0.6 m) longer.

PANEL ACTION: Accept.

PANEL STATEMENT: Metrication task group should check the conversion for consistency with NFPA rules.

(Log #1191)

19- 87 - (551-46(d)): Reject

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ

RECOMMENDATION: Reword Section 551-46(d) to read as follows:

(d) Labeling at Electrical Entrance. Each recreational vehicle shall have permanently affixed to the exterior skin, at or near the point of entrance of the power-supply cord(s), a label 3 in. (76 mm) X 1 3/4 in. (44.5 mm) minimum size, made of etched, metal-stamped, or embossed brass, stainless steel, or anodized or alclad aluminum not less than 0.020 in. (508 µm) thick, or equivalent ~~other suitable material [e.g. 0.005 in. (127 µm) thick plastic laminate)~~ that reads, as appropriate, either ... (REMAINDER UNCHANGED).

SUBSTANTIATION: Article 550 does not recognize the use of plastic laminate material for exterior labels. Recent action by the NFPA 501 Technical Committee on Electrical has removed this recognition as well. There have been concerns raised on the suitability of such material for an exterior environment due to exposure to ultraviolet rays, temperature changes, physical damage, and susceptibility to damage by flexing as the units are transported. Since the labels required are to be permanently affixed, it is felt that metal is the material to be used.

PANEL ACTION: Reject.

PANEL STATEMENT: The documention for this recommendation has not been provided.

19- 88 - (551-46(f) (New)): Reject

SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.

RECOMMENDATION: Add Section (f) to 551-46 to read as follows:

(f) Adapters. Adapters shall not be used which provide for the connection of a 30 amp, 125 volt plug to a 125/250 volt, 50 amp receptacle. Also, adapters shall not be used which provide for the connection of a 15 amp, 125 volt plug to a 30 amp, 125 volt connector.

SUBSTANTIATION: The use of the first adapter allows the connection of a recreational vehicle's electric-power supply cord which is only rated at 30 amps to a receptacle which is protected by a 50 amp circuit breaker. The second adapter allows the connection of any cord with a 15 amp, 125 volt plug to a receptacle which is protected by a 30 amp circuit breaker.

These adapters are sold in recreational vehicle (RV) supply stores and hardware stores.

I have stayed in at least one RV park where the owner had one of the adapters from 50 to 30 amp at electrical connection in an effort to restrict the amount of electricity each trailer could use. Most of these adapters had some overheating damage at the 30 amp connector.

PANEL ACTION: Reject.

PANEL STATEMENT: The recommendation would not be enforceable and, therefore, would not add to existing safety requirements.

19- 90 - (551-47(f), (g)): Accept in Part
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(f) ~~Sheath Armor.~~ Raceway and Cable Continuity ~~The sheath of nonmetallic sheathed cable, metal clad cable, and Type AC cable~~ Raceways and cable sheaths shall be continuous between ~~outlet~~ boxes and other enclosures.
(g) Delete present text and substitute:
Raceways and cables installed through holes, in notches, or parallel to, framing members shall comply with applicable provisions of Section 300-4.
Where cables without a metal sheath or armor, electrical nonmetallic tubing, and liquidtight flexible nonmetallic conduit pass through punched, cut, or drilled holes in metal members, the cable and raceway shall be protected by bushings or grommets securely fastened in the opening prior to installation of the cable or raceway.
SUBSTANTIATION: The provisions of (a) allow other type cables and raceways which warrant a requirement to be continuous, for consistency.
In (g) other suitable wiring methods covered by (a) should be included. If not included does that mean they are not permitted to pass through framing members? The proposal would correlate this section with Section 300-4 which is more comprehensive.
The grommet requirement is expanded to cover wiring methods which may be damaged by vibration during road travel.
Continuity should be required between all boxes, whether used as outlet boxes, pull boxes, junction boxes or device boxes.
PANEL ACTION: Accept in Part.
Revise to read as follows:
"(f) Raceway and Cable ContinuityRaceways and cable sheaths shall be continuous between boxes and other enclosures."
PANEL STATEMENT: Existing text in (g) is clear and does not require modification. Panel accepts recommendation to modify (f).

(Log #47)

19- 91 - (551-47(g)): Reject
NOTE: The following proposal consists of Comment 19-30 on Proposal 19-112 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 19-112 was:
Revise Section 551-47(g) as follows:
(g) Protected. Metal-clad, Type AC, or nonmetallic-sheathed cables and electrical nonmetallic tubing shall be permitted to pass through the centers of the wide side of 2-in. by 4-in. wood studs. However, they shall be protected where they pass through 2-in. by 2-in. wood studs or at other wood studs or frames where the cable or tubing would be less than 1 1/4 in. (31.8 mm) from the inside or outside surface. Steel plates on each side of the cable or tubing, or a steel tube, with not less than No. 16 MSG wall thickness, shall be installed to protect the cable or tubing. These plates or tubes shall be securely held in place. Where nonmetallic-sheathed cables pass through punched, cut, or drilled slots or holes in metal members, the cable shall be protected by bushings or grommets securely fastened in the opening prior to installation of the cable.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in Principle revise first sentence:
(g) Protected. ~~Metal-clad~~ Type MC, Type MI, Type AC ~~or~~ nonmetallic-sheathed cable, and electrical nonmetallic tubing shall be permitted to pass through the centers of the wide side of 2 in. by 4 in. ~~wood~~ studs.
SUBSTANTIATION: Type MI cable is permitted by Section 551-47(a). Metal-clad cable is a specific type and does not cover Type MI. Type MI should be included as it is in Section 300-4(a). (Type MI should also be included in (f) requirements). This application should also be permitted for studs of other material.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of Type MI cable has not been an issue because it is not used in this application. There has been no substantiation submitted to delete the word "wood".

19- 95 - (551-48(b)): Reject
SUBMITTER: Dale Jordal, Winnebago Ind. Inc.
RECOMMENDATION: New text to read as follows:
551-48. Conductors and Boxes.
(b) Free Conductor at Each Box. At least 4 inches (102 mm) of free conductor shall be left at each box except where conductors are intended to loop without joints.
SUBSTANTIATION: In an RV where space is at a premium, manufacturers are often forced to use the minimum square inch box allowed due to space limitations. The minimum sized box coupled with a device the size of a typical GFI receptacle makes a very snug and compact package when the excess wires are shoehorned into this box. Reverting back to the previous code in this situation would be of great benefit and should not cause any problems, as justified below.
Life expectancy of an RV is maybe a tenth that of a home. Home devices can be replaced "several times" and may need the extra conductor length if the wire needs to be clipped. Not applicable in the case of an RV. A device that is replaced more than once (if even once) would be unusual.
The RV is inhabited differently than a home. Typically, RVs would have less people living in it and also for a shorter duration, meaning less wear and tear on the devices that may need replacing.
In the 1996 NEC cycle, I believe 551-48(b) was deleted solely to match the NEC Housing Code. I am not aware that the 4 inch dimension caused any hardship for anyone. The fact is, houses are different than RVs and this is probably why 551-48(b) was put in 551.
I believe it needs to be added back in, as certain applications would benefit from a reduced conductor length frm 6 inches to 4 inches. It is clearly not a safety issue and would aid in the manufacturing of RVs when the extra space is not there.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing Code text is adequate.

19- 102 - (551-54(c)): Accept
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Revise text as follows:
(c) Insulated Neutral.
~~1.~~ The grounded circuit conductor (neutral) shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded (neutral) circuit terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded.
~~2.~~ Connection of electric ranges and electric clothes dryers utilizing a grounded (neutral) conductor, if cord-connected, shall be made with 4-conductor cord and 3-pole, 4-wire, grounding-type plug caps and receptacles.
SUBSTANTIATION: Material can be combined into one paragraph eliminating the need to add titles or list language to conform to the new Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #955)

19- 103 - (551-55(b), (e)): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Equipment Grounding and Bonding Conductors. Bare wires, insulated wire with an outer finish that is green or green with one or more ~~a~~ yellow stripes shall be used for equipment grounding or bonding conductors only.
(e) Grounding Continuity. Where more than one equipment grounding or bonding conductors of a branch circuit... (remainder unchanged).
SUBSTANTIATION: Bonding jumpers are part of grounding and should be included. Inclusion does not preclude other insulation color where installed outside of raceways or enclosures as permitted by Section 250-102(e), or as required by Section 551-56(b). Present wording which is limited to an equipment grounding conductor does not permit a green-insulated equipment bonding jumper inside a raceway, which is required by Section 250-102(e) reference to Section 250-119. Is this section intended to modify those sections?
PANEL ACTION: Accept.

(Log #3384)

19- 105 - (551-71): Reject
SUBMITTER: Tom Dunn, Rep. Outdoor Amusement Business Assn.
RECOMMENDATION: Add the following to Section 551-71:
"30 amp, 125 volt, receptacles shall not be replaced with 50 amp, 125/250 volt, receptacles without upgrading the supply to 50 amp, 125/250 volt."
SUBSTANTIATION: As a cheap way of upgrading the receptacles in a Recreational Vehicle (RV) park the 30 amp, 125 volt receptacles are replaced with 50 amp, 125/250 volt receptacles, and the existing 30 amp, single-pole circuit breaker is used to supply both "hot" pins of the 50 amp receptacle.
Problem one: Unsuspecting RVer's rent a space, plug into the 50 amp, 125/250 volt receptacle, turn on the air conditioner, leave their pets locked in the RV, and go sight-seeing. When they return, the 30 amp circuit breaker has tripped, and the pets are at least uncomfortable.
Problem two: The most common appliance in a RV which uses 220 volts is the clothes drier. However, these 50 amp, 125/250 volt receptacles do not supply 250 or 220 volts, only 125. Some people have endured the unnecessary expense of having a repair shop try to locate the nonexistent problem with their RV's clothes drier.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal is covered in the existing Code, such as 110-3(b).

(Log #426)

19- 108 - (551-72): Reject
SUBMITTER: Raymond J. DeStefano, Copper Valley Electric Assn.
RECOMMENDATION: Revise 551-72 to read as follows:
The recreational vehicle park secondary electrical distribution system to recreational vehicle sites shall be ~~derived from a~~ single-phase, 120/240 volt, ~~3 wire system,~~ nominal.
SUBSTANTIATION: Our utility has been involved in several disputes regarding this section of the code. The words "derived from" have caused confusion over the intent of this section. Building officials have interpreted this to mean that RV parks must take 120/240 service from the supplying utility. The proposed wording is simpler and clearer. The wording is identical to Section 550-21 (mobile home parks - distribution system), where the intent is the same as 551-72.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing Code language is sufficiently clear.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13
COMMENT ON AFFIRMATIVE:
BAUMAN: The NEC does not apply to the serving utility. Consequently, there is no requirement that the serving utility provide 120240-volt service. Section 551-72 only requires that 50-ampere recreational sites be derived from a single-phase, 120/240-volt 3-wire system. If the utility serves the customer with 120/208-volt or 277/480-volt, the customer would use transformer(s) to produce 120/240-volt for the 50-ampere outlets.
The misinterpretation that the submitter describes in his substantiation could be addressed by incorporating language similar to that used in 555-5. The first two sentences of 551-72 could read as follows: Each 50-ampere, 125/250-volt receptacle located at a recreational vehicle site shall be supplied with power of the same voltage class and rating corresponding to the rating of the receptacle. Other recreational vehicle site receptacles shall be permitted to be supplied from any grounded system that supplies 120-volt single-phase power.
The concept could be more simply stated by replacing the first two sentences of 551-72 with: Each receptacle located at a recreational vehicle site shall be supplied with power of the same voltage class and rating corresponding to the rating of the receptacle.

(Log #1149)

19- 109 - (551-72): Accept
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Revise second sentence to read:
"Other recreational vehicle sites with 125-volt, 20- and 30-ampere receptacles ~~may~~ shall be permitted to be derived from any grounded distribution system that supplies 120-volt single-phase power."
SUBSTANTIATION: Editorial change from permissive language to mandatory language to comply with Style Manual.
PANEL ACTION: Accept.

(Log #4108)

19- 110 - (551-72): Reject
SUBMITTER: Robert E. Molde, Northern States Power Co./Rep. Wisconsin Utilities Assn.
RECOMMENDATION: Revise text to read as follows:
551-72. Distribution System. The recreational vehicle park secondary electrical distribution system to a 50-ampere recreational vehicle sites shall be derived from a single-phase. 120/240 volt or 120/208 volt, 3-wire system.
SUBSTANTIATION: Most utilities provide a single-phase 120/208 volt service to their customers. What is the justification or substantiation to require that a customer add an additional

transformer to step the voltage up from 120/208 to 120/240? This causes the customer needless expense with no extra safety benefit.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter asked for the technical substantiation for the existing requirement but did not provide technical substantiation for the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #959)

19- 111 - (Table 551-73 and 551-73(d)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise heading for Table 551-73:
Demand Factors for Site Feeders and Services ~~entrance conductors~~ for Recreational Vehicle Parks. ~~Sites.~~
Revise last paragraph of (d):
Loads for other amenities such as, but not limited to, service buildings and swimming pools, shall be ~~sized~~ calculated separately and then be added to the value calculated for the recreational vehicle sites where they are ~~all~~ supplied by ~~one~~ a common service.
SUBSTANTIATION: Editorial. Service-entrance conductors for park sites refers to such conductors for a plot of ground for an individual recreational vehicle rather than service conductors for the park. The limitation to service-entrance conductors excludes application to service-laterals and service-drops. The word "services" includes such conductors and service-equipment.
The word "calculated" is suggested as preferable to "sized".
In (d) "one service" could be interpreted as one (separate) service for each amenity. The recreational park service could also supply one or more amenities but not "all", or all other amenities could be supplied by one service, separate from the park service. The proposal attempts to provide clearer wording to indicate that all, or any amenities supplied by the (common) park service are covered by the rule.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing Code text is sufficiently clear.

(Log #2955)

19- 112 - (Table 551-73): Reject
SUBMITTER: Merle J. Minor, Minor Repairs and Marketing
RECOMMENDATION: Delete Table 551-73.
Revise the sentence starting:
"The demand factors ~~set forth in Table 551-73 shall be the minimum allowable demand factors that shall be permitted in calculating load, etc.~~ shall be calculated 100 percent for service and feeders."
SUBSTANTIATION: There are many camp grounds wired close to the minimum requirements. This may be okay with minimum occupation. But, when all sites are occupied, there will be a corresponding drop in available VA to each sight, by way of its circuits demand factor. 551-73(c) points directly to this problem. It seems that no one on the Council has an RV. If so, this table would not be here.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter did not provide any technical substantiation for the change.

(Log #627)

19- 114 - (551-77(a)): Accept in Principle
Note: The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal regarding the SI units. This action will be considered by the Panel as a Public Comment.
SUBMITTER: James W. Finch, Kampgrounds of America, Inc. (KOA)
RECOMMENDATION: Revise to 551-77(a) to read as follows:
(a) Location. Where provided on back-in sites, the recreational vehicle site electrical supply equipment shall be located on the left (driver's) side of the parked vehicle, on a line that is ~~9 ft (2.74 m)~~ 6 ft (1.83 m) ± 1 ft (0.3 m) from the ~~longitudinal centerline~~ left edge (driver's side of the parked RV) of the stand and shall be located at any point on this line from the rear of the stand to 15 ft (4.57 m) forward of the rear of the stand.
For pull-through sites, the electrical supply equipment shall be permitted to be located at any point along the line that is 6 ft (1.83 m) ±1 ft (0.3 m) from the left edge (driver's side of the parked RV) of the stand from 16 ft (4.88 m) forward of the rear of the stand to ~~32 ft (9.75 m) forward of the rear of the stand~~ the center point between the two roads which give access to and egress from the pull through sites.
The left edge (driver's side of the parked RV) of the stand must be well marked.
SUBSTANTIATION: There are two distinct issues that require the electrical supply equipment to be moved 2 ft further from the left edge of the stand.
1. Expandable room sections have become quite prevalent in all types of larger RVs. Expandable room sections extend between 38 inches and 42 inches from either or both sides of the RV and can be located anywhere along the sides. Having the electrical supply equipment centered at 4 ft (48 in.) ±1 ft from the left edge of the stand does not give enough clearance between the extended expandable room sections and the supply equipment.
2. Many of the same large RVs have overhangs behind the rear axles of up to 15 ft. The tail swing on these units is considerable when they exit the site. When exiting to the left, the tail swings away from the utilities so it is not a problem. However, when exiting to the right, the tail swings towards the utilities and the electrical supply equipment can be in harms way.
Pull-through sites accommodate both tow vehicles that are pulling trailers and motor homes that have something in tow. It is KOA, Inc's experience that when the electrical supply is located in the center of the stand on the left side of the RV it will accommodate the largest percentage of RVs of all types without needing an extension cord. On a long site, the unit can pull forward or back-up to match the equipment and this location will accommodate all RVs. The supply equipment should not be located farther forward than the center of the site because the tail swing of the unit becomes more accentuated past this center point.
The location of the distance off the left side of the stand has been 9 ft ± 1 ft from the longitudinal centerline of the stand. This is ambiguous since the width of the stand changes where the electrical supply will be located. We cannot assume the width of the stand is always 10 ft. Even though construction is very often laid out and staked from the centerline the left edge (driver's side of the parked RV) is more accurate and less confusing which will ensure that the electrical supply equipment is far enough off the site.
The statement "the left edge (driver's side of the parked RV) of the stand must be well-marked" is needed so that the camper stays on the pad an is 6 ft ±1 ft from the power supply assembly.
These changes will permit safer accommodation of RVs with expandable room sections and/or long overhangs in new or remodeled RV parks.
PANEL ACTION: Accept in Principle.
Change "6 feet +/- 1 ft." to "5 feet to 7 feet". Also change "which give" to "that gives". In the last sentence, change "must to "shall" and delete "well".
Accept remaining changes.

PANEL STATEMENT: The changes are editorial made to meet the new style manual.

19- 115 - (551-77(d)): Accept in Principle
Note: The Technical Correlating Committee directs that the Panel reconsider the Panel Action and correlate with 380-8(a) regarding the SI units. This action will be considered by the Panel as a Public Comment.
SUBMITTER: James M. Imlah, City of Hillsboro, OR
RECOMMENDATION: Revise as follows:
(d) Mounting Height. Site supply equipment shall be located not less than 2 ft (610 mm) nor more than ~~6 1/2 ft~~ 6 ft 7 in. ~~(1.98 m)~~ (2.0 m) above the ground.
SUBSTANTIATION: The height requirements need to be consistent as elsewhere in the NEC, especially 380-8(a). Section 380-8(a) was changed in the 1996 NEC to have the measurement of 2 m even. The same change needs to be made to this section, 551-77(d).
PANEL ACTION: Accept in Principle.
The panel accepts the implementation of the metrication task group's actions. The panel does not accept the conversion to "6 ft 7 in". The conversion should read "6 ft 6 in".
PANEL STATEMENT: Implementation of the metrication rules will address this recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #960)

19- 116 - (551-80(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete present wording and substitute:
(a) General. Conductors used for direct burial application shall be of a type identified for such use. Splices or taps shall be permitted without boxes. Where boxes are provided they shall comply with Section 370-29. Splices and taps shall comply with Section 110-14.
SUBSTANTIATION: Editorial. The proposal is intended for clarification and correlation with other sections, e.g. 110-14, 230-30 Exception, 230-41 Exception, 300-5(e), 310-7, and 370-29. The intent of the word "continuous" is confusing and the second sentence does not appear to have a particular bearing on anything. As used in the context of other Code sections, "continuous" may mean unbroken, or electrically continuous. The last sentence infers it means electrically continuous and therefore superfluous since noncontinuous conductors don't provide a functional circuit.
PANEL ACTION: Reject.
PANEL STATEMENT: The current text is clear and the proposal contains redundant references.

5. In Section 552-41(a), replace "2 ft (610 mm)" with "600 mm (2 ft)" and replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
6. In Section 552-41(b)(1), replace "12 in. (305 mm)" with "300 mm (12 in.)".
7. In Section 552-41(b)(3), replace "12 in. (305 mm)" with "300 mm (12 in.)" and replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
8. In Section 552-41(c)(2), replace "6 ft (1.83 m)" with "1.8 m (6 ft)".
9. In Section 552-41(d), replace "2 ft (610 mm)" with "600 mm (2 ft)".
10. In Section 552-41(f)(1), replace "30 in. (762 mm)" with "750 mm (30 in.)".
11. In Section 552-44(b), replace "23 ft (7.0 m)" with "7.0 m (23 ft)"; "28 ft (8.5 m)" with "8.5 m (28 ft)"; "36 1/2 ft (11.13 m)" with "11 m (36 1/2 ft)"; and "3 ft (0.9 m)" with "900 mm (3 ft)" throughout.
12. In Section 552-44(d), replace "3 in. X 1 3/4 in. (76 mm X 44.5 mm)" with "75 mm X 45 mm (3 in. X 1 3/4 in.)"; "0.020-in. (0.508-mm)" with "0.51 mm (0.020 in.)"; and "0.005-in. (0.127-mm)" with "0.13 mm (0.005 in.)".
13. In Section 552-44(e), replace "15 ft (4.57 m)" with "4.5 m (15 ft)" and replace "18 in. (457 mm)" with "450 mm (18 in.)".
14. In Section 552-44(e) Exception, replace "15 ft (4.57 m)" with "4.5 m (15 ft)" throughout.
15. In Section 552-45(b), replace "24 in. (610 mm)" with "600 mm (24 in.)" and replace "30 in. (762 mm)" with "750 mm (30 in.)".
16. In Section 552-45(b) Exception, replace "22 in. (559 mm)" with "550 mm (22 in.)" and replace "2 in. (50.8 mm)" with "50 mm (2 in.)".
17. In Section 552-46(b)(1), replace "3 volt-amperes/ft^2 (32.26 VA/m^2)" with "33 VA/m^2 (3 volt-amperes/ft^2)".
18. In Section 552-47(a), replace "3 volt-amperes/ft^2" with "33 VA/m^2 (3 volt-amperes/ft^2)".
19. In Section 552-48(e) Exception No. 2, replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)" and replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)".
20. In Section 552-48(g), replace "2 in. by 4 in." with "2-by-4"; "2 in. by 2 in." with "2-by-2"; "1 1/4 in. (31.8 mm)" with "32 mm (1 1/4 in.)"; and "No. 16 MSG" with "1.35 mm (0.053 in.)".
21. In Section 552-48(h), replace "12 in. (305 mm)" with "300 mm (12 in.)" and replace "4 1/2 ft (1.37 mm)" with "1.4 m (4 1/2 ft)".
22. In Section 552-48(i), replace "8 in. (203 mm)" with "200 mm (8 in.)".
23. In Section 552-48(k), replace "0.030 in. (762 µm)" with "0.76 mm (0.030 in.)" and replace "0.040 in. (1.016 mm)" with "1.0 mm (0.040 in.)".
24. In Section 552-49(b), replace "6 in. (152 mm)" with "150 mm (6 in.)".
25. In Section 552-59(b), replace "0.020-in. (508-µm)" with "0.51 mm (0.020 in.)" and replace "3 in. X 1 3/4 in. (76 mm X 44.5 mm)" with "75 mm X 45 mm (3 in. X 1 3/4 in.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following. In Item 20, No. 16 MSG is considered to represent a nominal metal thickness, corresponding to a thickness value not commonly known or available to the users of the NEC. The equivalent nominal decimal thickness is 0.060 in., based on material standards and handbooks. However, since this value is nominal, a tolerance must be applied to achieve a minimum allowable thickness. The accepted industry practice is to apply a minus tolerance of 0.007 in. for 16 MSG, resulting in a minimum thickness of 0.053 in. (1.35 mm). The SI units and inch-pound numbers in parenthesis are not shown for Item 20's stud sizes since they are not a direct conversion and a Trade Size is provided.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1091)

19- 118 - (552): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 552 as follows:
552-10(b)(2) - change "No. 6 through 18" to "6 through 18 AWG"
552-10(c)(5) - change "No. 8" to "8 AWG" in two places
552-20(c) - change "No. 8" to "8 AWG"
552-57(c) - change "No. 8" to "8 AWG"
552-56(c) - change "No. 8" to "8 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

PANEL STATEMENT: The NEC Style of Manual does not specify the language used one way or another. The NFPA Manual of Style seems to prefer 10AWG. Product standards use 10 AWG or 10 AWG 110-6 says that the conductor sizes are expressed in AWG or in circular mils so the AWG is implied The panel recognizes that the TCC may desire to take a different action to be consistent with the Code.

(Log #2269)

19- 119 - (552-10): Accept in Principle

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ

RECOMMENDATION: Revise text as follows:

552-10. Low-Voltage Systems

(a) Low-Voltage Circuits. Low-voltage circuits furnished and installed by the park trailer manufacturer, other than those related to braking, are subject to this Code. Circuits supplying lights subject to federal or state regulations shall comply with applicable government regulations and this Code.

(b) Low-Voltage Wiring.

(1) Material. Copper conductors shall be used for low-voltage circuits.

Exception: A metal chassis or frame shall be permitted as the return path to the source of supply.

(2) Conductor Types. Conductors shall conform to the requirements for Type GXL, HDT, SGT, SGR, or Type SXL or shall have insulation in accordance with Table 310-13 or the equivalent. Conductor sizes No. 6 through 18 or SAE shall be listed. Single-wire, low-voltage conductors shall be of the stranded type.

FPN: See SAE Standard J1128-1995 for Types GXL, HDT, and SXL and SAE Standard J1127-1995 for Types SGT and SGR.

~~(3) Single-wire, low-voltage conductors shall be of the stranded type.~~

~~(4)~~ (3) Marking. All insulated low-voltage conductors shall be surface marked at intervals not greater than 4 ft (1.22 m) as follows.

a. Listed conductors shall be marked as required by the listing agency.

b. SAE conductors shall be marked with the name or logo of the manufacturer, specification designation, and wire gauge.

c. Other conductors shall be marked with the name or logo of the manufacturer, temperature rating, wire gauge, conductor material, and insulation thickness.

(c) Low-Voltage Wiring Methods.

(1) Physical Protection. Conductors shall be protected against physical damage and shall be secured. Where insulated conductors are clamped to the structure, the conductor insulation shall be supplemented by an additional wrap or layer of equivalent material, except that jacketed cables shall not be required to be so protected. Wiring shall be routed away from sharp edges, moving parts, or heat sources.

(2) Splices. Conductors shall be spliced or joined with splicing devices that provide a secure connection or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices shall first be spliced or joined to be mechanically and electrically secure without solder and then soldered. All splices, joints, and free ends of conductors shall be covered with an insulation equivalent to that on the conductors.

(3) Separation. Battery and other low-voltage circuits shall be physically separated by at least a 1/2-in. (12.7-mm) gap or other approved means from circuits of a different power source. Acceptable methods shall be by clamping, routing, or equivalent means that ensure permanent total separation. Where circuits of different power sources cross, the external jacket of the nonmetallic-sheathed cables shall be deemed adequate separation.

(4) Ground Connections. Ground connections to the chassis or frame shall be made in an accessible location and shall be mechanically secure. Ground connections shall be by means of copper conductors and copper or copper-alloy terminals of the solderless type identified for the size of wire used. The surface on which ground terminals make contact shall be cleaned and be free from oxide or paint or shall be electrically connected through the use of a cadmium, tin, or zinc-plated internal/external-toothed lockwasher or locking terminals. Ground terminal attaching screws, rivets or bolts, nuts, and lockwashers shall be cadmium, tin, or zinc-plated except rivets shall be permitted to be unanodized aluminum where attaching to aluminum structures.

~~(5)~~ The chassis-grounding terminal of the battery shall be bonded to the unit chassis with a minimum No. 8 copper conductor. In the event the power lead from the battery exceeds No. 8, then the bonding conductor shall be of an equal size.

(d) Battery Installations. Storage batteries subject to the provisions of this Code shall be securely attached to the unit and installed in an area vaportight to the interior and ventilated directly to the exterior of the unit. Where batteries are installed in a compartment, the compartment shall be ventilated with openings having a minimum area of 1.7 in.^{2} (1100 mm^2) at both the top and at the bottom. Where compartment doors are equipped for ventilation, the openings shall be within 2 in. (50.8 mm) of the top and bottom. Batteries shall not be installed in a compartment containing spark- or flame-producing equipment.

(e) Overcurrent Protection.

(1) Wiring. Low-voltage circuit wiring shall be protected by overcurrent protective devices rated not in excess of the ampacity of copper conductors~~as follows.~~ in accordance with Table 552-10(E)(1).

Table 552-10(e)(1). Low-Voltage Overcurrent Protection

[Insert Table 552-10(e)(1) from 1999 NEC here]

(2) Type. Circuit breakers or fuses shall be of an approved type, including automotive types. Fuseholders shall be clearly marked with maximum fuse size and shall be protected against shorting and physical damage by a cover or equivalent means.

FPN: For further information, see Standard for Electric Fuses (Cartridge Type), ANSI/SAE J554-1987; Standard for Blade Type Electric Fuses, SAE J1284-1988; and Standard for Automotive Glass Tube Fuses, UL 275-1993.

(3) Appliances. Higher current-consuming, dc appliances such as pumps, compressors, heater blowers, and similar motor-driven appliances shall be installed in accordance with the manufacturer's instructions.

Motors that are controlled by automatic switching or by latching-type manual switches shall be protected in accordance with Section 430-32(c).

(4) Location. The overcurrent protective device shall be installed in an accessible location on the unit within 18 in. (457 mm) of the point where the power supply connects to the unit circuits. If located outside the park trailer, the device shall be protected against weather and physical damage.

Exception: External low-voltage supply shall be permitted to have the overcurrent protective device within 18 in. (457 mm) after entering the unit or after leaving a metal raceway.

(f) Switches. Switches shall have a dc rating not less than the connected load.

(g) Lighting Fixtures. All low-voltage interior lighting fixtures rated more than 4 watts, employing lamps rated more than 1.2 watts, shall be listed.

SUBSTANTIATION: Changes add titles and use new layout in accordance with the new Style Manual. Existing 552-10(b)(3) is incorporated as new last sentence of (b)(2) as more appropriate placement. Remaining level renumbered accordingly. Existing 552-10(c)(5) is incorporated as last sentence of (c)(4). 552-10(e)(1) is revised to include specific reference to Table 552-10(e)(1) rather than using wording "as follows."

PANEL ACTION: Accept in Principle.

In the title (e) (1) change the word "wiring" to "rating" and in (b) (3), the lower case a, b,and c to (1),(2), (3).

PANEL STATEMENT: The change would further clarify the requirement.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13

VOTE ON PANEL ACTION:

AFFIRMATIVE: 13

(Log #966)

19- 120 - (Table 552-10(e)(1)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete the third column of the table.
SUBSTANTIATION: Editorial. The third column indicates wire type may be solid conductors for No. 14, 12, and 10 whether single-conductor or (jacketed) cable. Section 552-10(b)(3) specifies single-conductors shall be stranded type.
PANEL ACTION: Reject.
PANEL STATEMENT: Retaining the language in the third column maintains usability of the table requirements. The proposed change would require the user to refer to other parts of the Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #961)

19- 121 - (552-43(a), (b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(a) Feeder. The power supply to the park trailer shall be a feeder assembly rated not less than the computed load, consisting of not more than one listed 30-ampere or 50-ampere park trailer power supply cord with an integrally molded or securely attached plug cap, or a permanently installed feeder rated not less than 30-amperes.
(b) Power Supply Cord. If the park trailer has a power supply cord, it shall be permanently attached to the ~~distribution panel-board~~ main disconnecting means enclosure or to a junction box permanently connected to the ~~distribution panelboard~~ main disconnecting means enclosure. ~~with the free end terminating in a molded on attachment plug cap.~~
SUBSTANTIATION: Editorial. Not less than the load should be a specified minimum rating. The permanent feeder should be noted to have a minimum rating as required for cord assemblies. The latter part of (b) conflicts with (a) which allows a securely attached (nonmolded) plug cap. Where there is a separate disconnecting means not part of a panelboard, the cord should terminate there.
PANEL ACTION: Reject.
PANEL STATEMENT: Recommendation does not further clarify existing Code text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #2275)

19- 122 - (552-44(c)): Accept
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Revise text as follows:
(c) Attachment Plugs.
(1) Units with Two to Five 15- or 20-Ampere Branch Circuits.
(Remainder unchanged)
(2) Units with 50-Ampere Power Supply Assembly. (Remainder unchanged)
SUBSTANTIATION: Changes add titles in accordance with new Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #1190)

19- 123 - (552-44(d)): Reject
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Reword Section 552-44(d) as follows:
"(d) Labeling at Electrical Entrance. Each park trailer shall have permanently affixed to the exterior skin, at or near the point of entrance of the power-supply assembly, a label 3 in. (76 mm) x 1 3/4 in. (44.5 mm) minimum size, made of etched, metal-stamped, or embossed brass, stainless steel, or anodized or alclad aluminum not less than 0.020 in. (508 mm) thick, or equivalent ~~other suitable material [e.g., 0.005 in. (127 mm) thick plastic laminate]~~ that reads, as appropriate, either...". (remainder unchanged)
SUBSTANTIATION: Article 550 does not recognize the use of plastic laminate material for exterior labels. Recent action by the NFPA 501 Technical Committee on Electrical has removed this recognition as well. There have been concerns raised on the suitability of such material for an exterior environment due to exposure to ultraviolet rays, temperature changes, physical damage, and susceptibility to damage by flexing as the units are transported. Since the labels required are to be permanently affixed, it is felt that metal is the material to be used.
PANEL ACTION: Reject.
PANEL STATEMENT: The documention for this recommendation has not been provided.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #962)

19- 124 - (552-45(c)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise second sentence:
A single main disconnect ~~disconnecting means~~ shall be provided where fuses are used or where more than two circuit breakers are employed.
SUBSTANTIATION: Article 100 definition of "disconnecting means" indicates it may be a group of devices. The intent seems to be a requirement for a single device. The innocuous change proposed would make this clear.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text is clear. See Panel action on Proposal 19-84.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #963)

19- 125 - (552-46(b)(3)): Accept
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(3) General Appliances. (Including furnace, water heater, space heater, range, and central or room air conditioner, etc.). An individual branch circuit shall be permitted to supply any load for which it is rated. There shall be one or more circuits of adequate rating in accordance with the following:
FPN No. 1 No change
FPN No. 2: No change.
a. ~~Ampere rating of fixed appliances not over 50 percent of circuit rating if lighting outlets (receptacles, other than kitchen, dining area, and laundry, considered as lighting outlets) are on the same circuit.~~ The total rating of fixed appliances shall not exceed 50 percent of the circuit rating if lighting outlets, general-use receptacles, or both, are also supplied.
b. ~~For fixed appliances on a circuit without lighting outlets, the sum of rated amperes shall not exceed the branch circuit rating. Motor loads or other continuous duty loads shall not exceed 80 percent of the branch circuit rating.~~ For fixed appliances with a motor(s) larger than 1/8 horsepower the total computed load shall be based on 125 percent of the largest motor plus the sum of the other loads. Where a branch circuit supplies continuous load(s) or any combination of continuous and noncontinuous loads the branch-circuit conductor size shall be in accordance with Section 210-19(a).
c. The rating of a single cord- and plug-connected appliance ~~on a circuit with no other outlets~~ supplied by other than an individual branch circuit shall not exceed 80 percent of the circuit rating.
d. No change.
SUBSTANTIATION: Reference to an individual branch circuit, per Section 210-23, is proposed as present c. modifies that section and limits load to 80 percent of the circuit rating regardless of whether a motor or continuous load is served. What is the reasoning? Present c. literal wording does not accomplish what is apparently intended since one "outlet" may contain multiple receptacles. Present a. is reworded in a more lucid form. Present b. is reworded along Article 210 requirements and references continuous load. The present "continuous duty" loads seems to infer continuous loads. Continuous duty, per definition, is not necessarily the same as continuous load. Since this section apparently modifies Article 210 continuous load appliances such as

water heaters, space heaters, etc., should be provided for. Present wording is not reasonable for a nonmotor operated noncontinuous load appliance.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #357)

19- 126 - (552-47): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise first paragraph:
CALCULATIONS. The following method shall be employed in computing the ~~supply cord~~ feeder assembly and distribution-panelboard load ~~for each feeder assembly~~ for each park trailer in lieu of the procedure shown in ~~Article~~ Section 220-3 and shall be based on a 3-wire 120/240-volt supply with 120-volt loads balanced as far as practicable between the two phases of the 3-wire system,or on a 2-wire 120-volt supply, as applicable.
SUBSTANTIATION: Present wording appears limited to cord feeders; Section 552-43(a) indicates a permanent feeder is permitted. The reference to Article 220 indicates Section 220-30 cannot be used but Section 552-47(c) indicates it is permitted. Trailers are permitted to be supplied by 120-volt 2-wire systems but this section requires calculation based on 3-wire 120/240-volt supply. "Insofar as practical" would allow for loads that cannot be exactly balanced.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation does not further clarify existing text.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #964)

19- 127 - (552-48(f), (g), (m)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(f) ~~Sheath Armor~~ Mechanical Continuity-Raceways and Cables. ~~The sheath of nonmetallic sheathed cable, metal clad cable, and Type AC cable~~ Raceways, cable armor, cable sheaths, and low-voltage conductors shall be continuous between ~~outlet~~ boxes, and other enclosures, and equipment.
(g) Protected. ~~Metal-clad, Type AC, or nonmetallic sheathed cables~~ Raceways, cables, and low-voltage conductors shall be permitted to pass through the centers of the wide side of nominal 2 in. by 4 in. wood ~~studs~~ framing members or nominal 4 in. metal framing members. However, they shall be protected where they pass through 2 in. by 2 in. wood studs ~~or at other wood studs or frames where the cable or tubing~~ or other framing members where the raceways, cables, or low-voltage conductors would be less than 1-1/4 in. (38 mm) from the inside or outside edge ~~surface.~~ This protection shall consist of ~~Steel~~ steel plates or a steel tube ~~with~~ not less than 1/16 in. (1.59 mm) thick. ~~No. 16 MSG wall thickness shall be installed to protect the cable or tubing.~~ These plates or tubes shall be securely held in place. Where nonmetallic-sheathed cables, liquidtight flexible nonmetallic conduit, electrical nonmetallic tubing, or low-voltage conductors without cable armor pass through punched, cut, or drilled slots or holes in metal members they ~~the cable~~ shall be protected by bushings or grommets securely fastened in the opening prior to installation of the cable, raceway, or low-voltage conductors.
Exception: Protection shall not be required for raceways as covered in Articles 345, 346, 347, and 348.
Cables, raceways, and low-voltage conductors installed parallel to framing members shall be in accordance with Section 300-4(d).
(m) Moisture or Physical Damage. Where outdoor or under-chassis wiring is 120-volts, nominal, or over, and is exposed to moisture or physical damage the wiring shall be protected by rigid metal conduit, intermediate metal conduit, or by electrical metallic tubing or rigid nonmetallic conduit, or Type MI cable, that is closely routed against frames and equipment enclosures, or other raceway or cable that is identified for the application.
SUBSTANTIATION: In (f) the required continuity should apply to all wiring methods permitted by Parts B and D. Boxes should not be limited to those designated as "outlet" but should include all boxes.
Subsection (g) should apply to all applicable wiring methods permitted by Sections 552-10 and 552-48(a), including certain raceways, Type MI cable, and low-voltage conductors, and to framing members other than wood studs. There is no need for a protection plate on both edges of a stud where an off-center bored hole provides clearance to one edge. (Not prohibited by this section). Where wiring methods other than nonmetallic-sheathed cables are subject to damage from hole edges in metal members, as from road travel vibration, they warrant the grommet requirement also.
Type MI cable is well suited to the conditions of (m) for close routing along frames due to small diameter, it is moisture and damage resistant, and there is no restriction on number of bends.
If the provisions of Section 300-4(d) are considered necessary for safety in other buildings and structures, those requirements should be specified in this article. Does the type of structure alter the need? Since the specifics of (g) closely track Section 300-4(a)(1) in lieu of a simple reference to that section, it is presumed Section 300-4(d) does not apply, by intent.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing Code text is clear and there is no need to extend the requirements to low voltage conductors.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #48)

19- 128 - (552-48(g)): Reject
NOTE: The following proposal consists of Comment 19-46 on Proposal 19-151 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 19-151 was:
Revise Section 552-48(g) as follows:
(g) Protected. Metal-clad, Type AC, or nonmetallic-sheathed cables and electrical nonmetallic tubing shall be permitted to pass through the centers of the wide side of 2-in. by 4-in. wood studs. However, they shall be protected where they pass through 2-in. by 2-in. wood studs or at other wood studs or frames where the cable or tubing would be less than 1 1/4 in. (38 mm) from the inside or outside surface. Steel plates on each side of the cable or tubing, or a steel tube, with not less than No. 16 MSG wall thickness, shall be installed to protect the cable or tubing. These plates or tubes shall be securely held in place. Where nonmetallic-sheathed cables pass through punched, cut, or drilled slots or holes in metal members, the cable shall be protected by bushings or grommets securely fastened in the opening prior to installation of the cable.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Accept in principle revise first sentence:
(g) Protected. ~~Metal-clad~~ Type MC, Type MI, Type AC, ~~or~~ nonmetallic-sheathed cable, and electrical nonmetallic tubing shall be permitted to pass through the centers of the wide side of 2 in. by 4 in. ~~wood~~ studs.
SUBSTANTIATION: Type MI cable is permitted by Section 552-48(a). Metal-clad cable is a specific type and does not cover Type MI. (Type MI should also be included in (f) requirements). Type MI cable should be included in this section as it is in Section 300-4(a). This application should also be permitted for studs of other material.
PANEL ACTION: Reject.
PANEL STATEMENT: The use of Type MI cable has not been an issue because it is not used in this application. There has been no substantiation submitted to delete the word "wood".

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Revise text as follows:
(c) Insulated Neutral.
~~(1)~~ The grounded circuit conductor (neutral) shall be insulated from the equipment grounding conductors and from equipment enclosures and other grounded parts. The grounded (neutral) circuit terminals in the distribution panelboard and in ranges, clothes dryers, counter-mounted cooking units, and wall-mounted ovens shall be insulated from the equipment enclosure. Bonding screws, straps, or buses in the distribution panelboard or in appliances shall be removed and discarded.
~~(2)~~ Connection of electric ranges and electric clothes dryers utilizing a grounded (neutral) conductor, if cord-connected, shall be made with 4-conductor cord and 3-pole, 4-wire, grounding-type plug caps and receptacles.
SUBSTANTIATION: Material can be combined into one paragraph eliminating the need to add titles or list language to conform to the new Style Manual.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 13
VOTE ON PANEL ACTION:
AFFIRMATIVE: 13

(Log #356)

19- 133 - (552-61 (New)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add 552-xx. Distribution System. The recreational vehicle park electrical distribution for park trailers shall be in accordance with Section 551-72.
SUBSTANTIATION: Section 552-1 suggests the definition of Recreational Vehicle and Recreational Vehicle Park apply to this article. It is not clear if Section 551-72 is applicable, even though equally warranted for this article. A specific reference to that section would be helpful to code users.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation is outside of the scope of 552.

ARTICLE 553 — FLOATING BUILDINGS

(Log #1410)

19- 134 - (553-5): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Delete this section, or alternatively revise to read as follows:
Service Conductors. One set of service conductors shall be permitted to serve more than one set of service equipment, and the limitation of not more than six disconnects at any one location shall not apply.
SUBSTANTIATION: This section is not clear whether intent is to modify the qualification re: number and location of disconnects covered in Section 230-40, Exception No. 2 which allows what this section permits. If modification is intended, it should be clearly stated, and if not, this section is unnecessary. Since a "set" of service equipment may be considered to be a single enclosure with six disconnects or six separate disconnect/overcurrent device enclosures the literal wording of this section, if considered a modification of Section 230-40, Exception No. 2 allows any number of disconnect/overcurrent devices at any one location.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided technical substantiation for allowing more than six disconnects.

ARTICLE 555 — MARINAS AND BOATYARDS

(Log #442)

19- 135 - (555): Accept

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action in part. The Technical Correlating Committee directs the Panel to reconsider the second sentence of the Scope relative to the statement of intent. This action will be considered by the panel as a public comment. The Technical Correlating Committee directs that the action on this proposal be rewritten to comply with the NEC Style Manual regarding references to entire Articles.

SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ

RECOMMENDATION: ARTICLE 555 -- Marinas and Boatyards

~~555-1 Scope~~

~~This article covers the installation of wiring and equipment in the areas comprising fixed or floating piers, wharfs, docks, and other areas in marinas, boatyards, boat basins, boathouses, and similar occupancies that are used, or intended for use, for the purpose of repair, berthing, launching, storage, or fueling of small craft and the moorage of floating buildings.~~

~~555-2. Application of Other Articles~~

Wiring and equipment for marinas and boatyards shall comply with this article and also with the applicable provisions of other articles of this Code.

~~FPN: For disconnection of auxiliary power from boats, see Fire Protection Standard for Pleasure and Commercial Motor Craft, NFPA 302-1994.~~

~~555-3. Receptacles~~

Where shore power is supplied, those accommodations for boats 20 ft (6.1 m) or less in length shall be equipped with shore-power receptacles of a locking and grounding type rated at not less than 20 amperes.

~~Where shore power is supplied to accommodations for boats longer than 20 ft (6.1 m) in length, shore-power receptacles of a locking and grounding type rated at 30 amperes or more shall be provided.~~

~~Fifteen- and 20-ampere, single-phase, 125-volt receptacles other than those supplying shore power to boats located at piers, wharfs, and other locations shall be protected by ground-fault circuit interrupters.~~

FPN No. 1: For various configurations and ratings of locking- and grounding-type receptacles and caps, see National Electrical Manufacturers Association's Standard for Dimensions of Attachment Plugs and Receptacles, ANSI/NEMA 18WD 6-1989.

~~FPN No. 2: For locking- and grounding-type receptacles for auxiliary power to boats, see Fire Protection Standard for Marinas and Boatyards, NFPA 303-1995.~~

~~FPN No. 3: In locating receptacles, consideration should be given to the maximum tide level and wave action. See Fire Protection Standard for Marinas and Boatyards, NFPA 303-1995, for establishment of datum plane.~~

~~555-4. Disconnecting Means~~

~~A readily accessible disconnecting means shall be provided by which each boat can be isolated from its supply circuit. The disconnecting means shall consist of a circuit breaker or switch, or both, and shall be located within sight of the shore power connection and is intended to constitute the means of cutoff of the supply to the boat.~~

~~555-5. Branch Circuits~~

~~Each single receptacle that supplies shore power to boats shall be supplied from a power outlet or panelboard by an individual branch circuit of the voltage class and rating corresponding to the rating of the receptacle.~~

~~FPN: Supplying receptacles at voltages other than the voltages marked on the receptacle may cause overheating or malfunctioning of connected equipment, for example, supplying single-phase, 120/240-volt, 3-wire loads from a 208Y/120-volt, 3-wire source.~~

~~555-6. Feeders and Services~~

~~The load for each feeder and/or service circuit supplying receptacles that supply shore power for boats shall be calculated as follows. These calculations may be modified as indicated in sections (a) and (b).~~

~~Number of Receptacles~~	~~Sum of the Rating of the Receptacles (percent)~~
~~1–4~~	~~100~~
~~5–8~~	~~90~~
~~9–14~~	~~80~~
~~15–30~~	~~70~~
~~31–40~~	~~60~~
~~41–50~~	~~50~~
~~51–70~~	~~40~~
~~71–plus~~	~~30~~

~~a. Where shore power accommodations provide two receptacles specifically for an individual boat slip and these receptacles have different voltages (for example, one 30-ampere, 125-volt and one 50-ampere, 125/250-volt), only the receptacle with the larger kilowatt demand shall be required to be calculated.~~

~~b. If the facility being installed includes individual kilowatt-hour submeters for each slip, and is being calculated using the criteria listed in Section 555-6, the total demand amperes may be multiplied by 0.9 to achieve the final demand amperes.~~

~~FPN: These demand factors may be inadequate in areas of extreme hot or cold temperatures with loaded circuits for heating, air-conditioning, or refrigerating equipment.~~

~~555-7. Wiring Methods~~

~~The wiring method shall be of a type identified for use in wet locations. Extra-hard-usage portable power cable listed for both wet locations and sunlight resistance shall be permitted for a feeder where flexibility is required.~~

~~FPN: For further information on wiring methods for various locations and for establishment of datum plane, see Fire Protection Standard for Marinas and Boatyards, NFPA 303-1995.~~

~~555-8. Grounding~~

~~(a) Equipment to Be Grounded. The following items shall be connected to an equipment grounding conductor run with the circuit conductors in a raceway or cable:~~

~~1. Boxes, cabinets, and all other metal enclosures~~

~~2. Metal frames of utilization equipment~~

~~3. Grounding terminals of grounding-type receptacles~~

~~(b) Type of Equipment Grounding Conductor. The equipment grounding conductor shall be an insulated copper conductor with a continuous outer finish that is either green or green with one or more yellow stripes.~~

~~Exception: The equipment grounding conductor of Type MI cable shall be permitted to be identified at terminations.~~

~~(c) Size of Equipment Grounding Conductor. The insulated copper equipment grounding conductor shall be sized in accordance with Section 250-122 but not smaller than No. 12.~~

(d) Branch-Circuit Equipment Grounding Conductor. The insulated equipment grounding conductor for branch circuits shall terminate at a grounding terminal in a remote panelboard or the grounding terminal in the main service equipment.

~~(e) Feeder Equipment Grounding Conductors. Where a feeder supplies a remote panelboard, an insulated equipment grounding conductor shall extend from a grounding terminal in the service equipment to a grounding terminal in the remote panelboard.~~

~~555-9. Wiring Over and Under Navigable Water~~

~~Wiring over and under navigable water shall be subject to approval by the authority having jurisdiction.~~

~~555-10. Gasoline Dispensing Stations — Hazardous (Classified) Locations~~

~~Electrical equipment and wiring located in gasoline dispensing stations shall comply with Article 514.~~

~~FPN: For further information, see Automotive and Marine Service Station Code, NFPA 30A-1996, and Fire Protection Standard for Marinas and Boatyards, NFPA 303-1995.~~

~~555-11. Location of Service Equipment~~

~~The service equipment for floating docks or marinas shall be located adjacent to, but not on or in, the floating structure.~~

555.1 Scope.

This article covers the installation of wiring and equipment in the areas comprising fixed or floating piers, wharfs, docks, and other areas in marinas, boatyards, boat basins, boathouses, yacht clubs, boat condominiums, docking facilities associated with residential condominiums, any multiple docking facility, or similar occupancies, and facilities that are used, or intended for use, for the purpose of repair, berthing, launching, storage, or fueling of small craft and the moorage of floating buildings.

A single, private, non-commercial docking facility for a one-family dwelling, is not intended to be covered by this Article.

FPN: See *Fire Protection Standard for Marinas and Boatyards*, NFPA 303-1995 for additional information

~~555.2 Definitions~~.

Electrical Datum Plane. The electrical datum plane is defined as follows:

(a) In land areas subject to tidal fluctuation, the electrical datum plane is a horizontal plane 2 ft (606 mm) above the highest tide level for the area occurring under normal circumstances, i.e., highest high tide.

~~*(b) In land areas not subject to tidal fluctuation, the electrical*~~ *datum plane is a horizontal plan~~e 2 ft (606 mm) above the highest water~~ level for the area occurring under normal circumst~~ances.*

(c) The electrical datum plane for floating piers and landing stages that are (1) installed to permit rise and fall response to water level, without lateral movement, and (2) that are so equipped that they can rise to the datum plane established for (a) or (b) above, is a horizontal plane 30 in. (762mm) above the water level at the floating pier or landing stage and a minimum of 12 in. (305 mm) above the level of the deck.

Marine Power Outlet. An enclosed assembly that can include receptacles, circuit breakers, fused switches, fuses, watt-hour meter(s), and monitoring means approved for marine use.

555.4 Distribution System. Yard and pier distribution systems shall not exceed 600 volts phase to phase.

555.5 Transformers. Transformers and enclosures shall be specifically approved for the intended location. The bottom of enclosures for transformers shall not be located below the electrical datum plane.

555.7 Location of Service Equipment. The service equipment for floating docks or marinas shall be located adjacent to, but not on or in, the floating structure.

555.9 Electrical Connections. All electrical connections shall be located at least 12 in. (305 mm) above the deck of a floating pier. All electrical connections shall be located at least 12 in. (305 mm) above the deck of a fixed pier, but not below the electrical datum plane.

555.10 Electrical Equipment Enclosures.

(A) Securing and Supporting. Electrical equipment enclosures installed on piers above deck level shall be securely and substantially supported by structural members, independent of any conduit connected to them. If enclosures are not attached to mounting surfaces by means of external ears or lugs, the internal screw heads shall be sealed to prevent seepage of water through mounting holes.

(B) Location. Electrical equipment enclosures on piers shall be located so as not to interfere with mooring lines.

555.11 Circuit Breakers, Switches, Panelboards, and Marine Power Outlets.

(A) Overcurrent Protection. Overcurrent protection for feeders or branch circuits shall be provided by the use of circuit breakers to avoid the difficulty of fuse replacement in gasketed enclosures.

(B) Enclosures. Circuit breakers and switches installed in gasketed enclosures shall be arranged to permit required manual operation without exposing the interior of the enclosure. All such enclosures shall be arranged with a weep hole to discharge condensation.

555.12 Load Calculations for Service and Feeder Conductors. The load for each service and/or feeder circuit supplying receptacles that provide shore power for boats shall be calculated using the demand factors shown in Table 555.12(A). These calculations shall be permitted to be modified as indicated in notes (1) and (2). General lighting and other loads shall be calculated in accordance with Article 220. The minimum rating and size of conductors shall comply with Article 215 or Article 230 as applicable.

Table 555.12(A) Demand Factors

Number of Receptacles	Sum of the Rating of the Receptacles (percent)
1-4	100
5–8	90
9–14	80
15–30	70
31–40	60
41–50	50
51–70	40
71–plus	30

Note 1. Where shore power accommodations provide two receptacles specifically for an individual boat slip and these receptacles have different voltages (for example, one 30 ampere, 125 volt and one 50 ampere, 125/250 volt), only the receptacle with the larger kilowatt demand shall be required to be calculated.

Note 2. If the facility being installed includes individual kilowatt-hour submeters for each slip, and is being calculated using the criteria listed in Table 555.12(A), the total demand amperes may be multiplied by 0.9 to achieve the final demand amperes.

FPN: These demand factors may be inadequate in areas of extreme hot or cold temperatures

with loaded circuits for heating, air-conditioning, or refrigerating equipment.

555.13 Wiring Methods and Installation.

(A) Wiring Methods.

(1) General. Wiring methods of Chapter 3 shall be permitted where identified for use in wet locations.

(2) Portable Power Cables. Extra-hard usage portable power cables rated not less than 167^{0}F (75^{0}C), 600 volts, listed for both wet locations and sunlight resistance, having an outer jacket rated to be resistant to temperature extremes, oil, gasoline, ozone, abrasion, acids, and chemicals shall be permitted as follows:

1. As permanent wiring on the underside of piers (floating or fixed).

2. Where flexibility is necessary as on piers composed of floating sections.

(3) Temporary Wiring. Temporary wiring, except as permitted by Article 305, shall not be used to supply power to boats.

(B) Installation.

(1) Overhead Wiring. Overhead wiring shall be installed to avoid possible contact with masts and other parts of boats being moved in the yard.

(a) Conductors and cables shall be routed to avoid wiring closer than 20 ft (6.1 m) from the outer edge or any portion of the yard that can be used for moving vessels or stepping or unstepping masts.

(2) Outside Branch Circuits and Feeders. Outside branch circuits and feeders shall comply with Article 225 except that clearances for overhead wiring in portions of the yard other than those described in (B)(1) shall not be less than 18 ft (5.49 m) above grade.

(3) Wiring Over and Under Navigable Water. Wiring over and under navigable water shall be subject to approval by the authority having jurisdiction

FPN: See *Fire Protection Standard for Marinas and Boatyards*, NFPA 303-1995 for warning

sign requirements.

(4) Portable Power Cables.

(a) Where portable power cables are permitted by 555.13(A)(2), the installation shall comply with the following.

1. Cables shall be properly supported.

2. Cables shall be located on the underside of the pier.

3. Cables shall be securely fastened by nonmetallic clips to structural members other than the deck planking.

4. Cables shall not be installed where subject to physical damage.

5. Where cables pass through structural members they shall be protected against chafing by a permanently installed oversized sleeve of nonmetallic material.

(b) Where portable power cables are used as permitted in 555.13(a)(2)2. there shall be an approved junction box of corrosion-resistant construction with permanently installed terminal blocks on each pier section to which the feeder and feeder extensions are to be connected. Metal junction boxes and their covers, and metal screws and parts that are exposed externally to the boxes, shall be of corrosion-resistant materials, or protected by material resistant to corrosion.

(5) Protection. Rigid metal or nonmetallic conduit suitable for the location shall be installed to protect wiring above decks of piers and landing stages and below the enclosure that it serves. The conduit shall be connected to the enclosure by full standard threads. The use of special fittings of nonmetallic material to provide a threaded connection into enclosures on rigid nonmetallic conduit, employing joint design as recommended by the conduit manufacturer for attachment of the fitting to the

conduit will be acceptable provided the equipment and method of attachment are approved and the assembly meets the requirements of installation in damp or wet location as applicable.

555.15 Grounding. Wiring and equipment within the scope of this article shall be grounded as specified in Article 250 and with the following additional requirements.

(A) Equipment to Be Grounded. The following items shall be connected to an equipment grounding conductor run with the circuit conductors in the same raceway, cable, or trench:

1. Metal boxes, metal cabinets, and all other metal enclosures.
2. Metal frames of utilization equipment.
3. Grounding terminals of grounding-type receptacles.

(B) Type of Equipment Grounding Conductor. The equipment grounding conductor shall be an insulated copper conductor with a continuous outer finish that is either green or green with one or more yellow stripes. The equipment grounding conductor of Type MI cable shall be permitted to be identified at terminations. For conductors larger than No. 6, or where multiconductor cables are used, re-identification of conductors as allowed in 250.119(A)(2) and (3) or 250.119(B)(2) and (3) shall be permitted.

(C) Size of Equipment Grounding Conductor. The insulated copper equipment grounding conductor shall be sized in accordance with 250.122 but not smaller than No. 12.

(D) Branch-Circuit Equipment Grounding Conductor. The insulated equipment grounding conductor for branch circuits shall terminate at a grounding terminal in a remote panelboard or the grounding terminal in the main service equipment.

(E) Feeder Equipment Grounding Conductors. Where a feeder supplies a remote panelboard, an insulated equipment grounding conductor shall extend from a grounding terminal in the service equipment to a grounding terminal in the remote panelboard.

555.17 Disconnecting Means for Shore Power Connection(s). Disconnecting means shall be provided to isolate each boat from its supply connection(s).

(A) Type. The disconnecting means shall be permitted to consist of a circuit breaker, switch, or both, and shall be properly identified as to which receptacle it controls.

(B) Location. The disconnecting means shall be readily accessible, located not more than 30 in. (762 mm) from the receptacle it controls, and shall be located in the supply circuit ahead of the receptacle. Circuit breakers or switches located in marine power outlets complying with this section shall be permitted as the disconnecting means.

555.19 Receptacles. Receptacles shall be located not less than 24 in. (610 mm) above the deck surface of the pier, and not below the electrical datum plane on a fixed pier.

(A) Shore Power Receptacles.

(1) Enclosures. Receptacles intended to supply shore power to boats shall be housed in marine power outlets listed for wet locations, listed enclosures protected from the weather, or listed weatherproof enclosures. The weatherproof integrity of the assembly shall not be affected when the receptacles are in use with any type of properly configured booted or non-booted attachment plug/cap inserted.

(2) Strain relief. Means shall be provided to reduce the strain on the plug and receptacle caused by the weight and catenary angle of the shore power cord by either of the following methods:

(a) The receptacle face shall be at any angle from horizontal to 65 degrees below horizontal.

See Figure 555.19(A)(2)(a).

(b) Separate mechanical strain relief which will not damage the shore power cord.

(3) Branch Circuits. Each single receptacle that supplies shore power to boats shall be supplied from a marine power outlet or panelboard by an individual branch circuit of the voltage class and rating corresponding to the rating of the receptacle

FPN: Supplying receptacles at voltages other than the voltages marked on the receptacle may cause overheating or malfunctioning of connected equipment, for example, supplying single-phase, 120/240-volt, 3-wire loads from a 208Y/120-volt, 3-wire source.

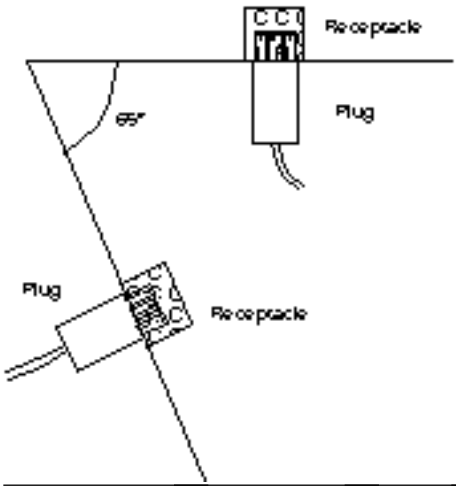

Figure 555.19(A)(2)(a) Example of receptacle face position

(4) Ratings. Receptacles that provide shore power for boats shall be rated not less than 30 amperes and shall be single outlet type.

FPN: For locking- and grounding-type receptacles for auxiliary power to boats, see *Fire Protection Standard for Marinas and Boatyards*, NFPA 303-1995.

(a) Receptacles rated not less than 30 amperes nor more than 50 amperes shall be of the locking- and grounding-type.

FPN: For various configurations and ratings of locking- and grounding-type receptacles and caps, see National Electrical Manufacturers Association's *Standard for Dimensions of Attachment Plugs and Receptacles*, ANSI/NEMA 18WD 6-1989.

(b) Receptacles rated for 60 amperes or 100 amperes shall be of the pin and sleeve type.

FPN: For various configurations and ratings of pin and sleeve receptacles, see ANSI/UL 1686, *UL Standard for Safety Pin and Sleeve Configurations*.

(B) Other Than Shore Power.

(1) Ground-Fault Circuit Interrupter (GFCI) Protection for Personnel. Fifteen- and 20-ampere, single-phase, 125-volt receptacles installed outdoors, in boathouses, in buildings used for storage, maintenance, or repair where portable electrical hand tools, electrical diagnostic equipment, or portable lighting equipment are to be used shall be provided with GFCI protection for personnel. Receptacles in other locations shall be protected in accordance with 210.8(B).

(2) Marking. Receptacles, other than those supplying shore power to boats shall be permitted to be housed in marine power outlets with the receptacles that provide shore power to boats, provided they are marked to clearly indicate that they are not to be used to supply power to boats.

555.21 Gasoline Dispensing Stations – Hazardous (Classified) Locations. Electrical wiring and equipment located at, or serving gasoline dispensing stations shall comply with Article 514 in addition to the requirements of this article.

555.23 Marine Hoists, Railways, Cranes, and Monorails. Motors and controls for marine hoists, railways, cranes, and monorails shall not be located below the electrical datum plane. Where it is necessary to provide electric power to a mobile crane or hoist in the yard, and a trailing cable is utilized, it shall be a listed portable power cable rated for the conditions of use and be provided with an outer jacket of distinctive color for safety.

SUBSTANTIATION: This proposal offers a total rewrite of Article 555 that incorporates the physical installation rules contained in NFPA 303, Fire Protection Standard for Marinas and Boatyards. The two documents have for some time been in basic agreement as far as installation rules were concerned. However, the NEC has never stated certain rules in the same depth as NFPA 303. Indeed, in the nine specific installation rule sections in Article 555, the user of the NEC is referred to NFPA 303 four times in fine print notes. Many AHJ's have had difficulty in applying the specific rules in NFPA 303 due to these references being in explanatory fine print

notes which are not enforceable as Code. Those who do have the ability to enforce these other referenced standards find that in the vast majority of cases, the installers do not have access to them and are, therefor, not aware of the specific installation requirements. These requirements are critical in ensuring that the installation meets all applicable safety rules. The NEC is the primary installation requirement document used by electrical contractors around the country and the book they use almost exclusively does not contain the requirements they must meet. The concept of the proposal is similar to that which was applied to NFPA 20 and Article 695, put the installation requirements into the NEC and leave the performance and testing requirements in the other NFPA standard. NFPA 303 is currently in its change cycle and many of the accepted proposals to date remove specific or redundant requirements from NFPA 303 and refer the user of that document to the National Electrical Code. This proposal, while offering substantive technical changes to the NEC, does not change any of the technical requirements from those that were found in NFPA 303. Specific technical substantiation for these requirements may be found in the ROP for NFPA 303. In some cases paragraphs have been combined or reworded to meet the NEC Style Manual and the entire format is written to conform with the latest edition of the Style Manual recently adopted.

One major change to Article 555 appears in 555.1 Scope. For several cycles there has been a conflict between the two documents with regards to applicability of the rules to residential docking facilities. NFPA 303 for some time has indicated that the standard was not applicable to single family docks, this proposal brings that intent into Article 555. A designer, installer, or homeowner could certainly apply Article 555 to a particular installation if he or she so desired, but the requirements would not be mandated by the Code. There does not appear to be any statistical information that indicate safety at private, single-family residential docks has been compromised by applying the general rules of the NEC to their installation. A companion proposal is being submitted to CMP-2 to add GFCI requirements back into 210-8 for residential boathouses. The submitter understands that the Technical Correlating Committee has jurisdiction for the "scope" provisions.

The definition of "electrical datum plane" has been added to Article 555 along with specific installation rules for equipment to be located above that plane. The specific wiring methods and installation rules formerly referenced through fine print notes have been added.

Another significant change is found in 555.19(A)(4) regarding the rating of receptacles to be installed for shore power. NFPA 303 does not and has not required a specific rating of receptacle dependent on the length of the boat. It sets a minimum rating and leaves it up to the designer and owner to provide the receptacles they deem necessary based on projected usage of the slips. This minimum rating is being changed to 30 amperes as information available to the NFPA 303 Technical Committee indicates that there are no longer any boats being manufactured with shore power provisions of 20 amperes nor have they been manufactured for a number of years.

The proposal adds requirements for 60 and 100 ampere pin and sleeve receptacles that have never been mentioned in Article 555.

Acceptance of this proposal will ensure that the installers and authorities having jurisdiction have access to all the installation rules that should have been applied to these installations.

PANEL ACTION: Accept.
PANEL STATEMENT: This proposal offers scope language which is the jurisdiction of the TCC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #967)

19- 136 - (555-1, Exception (New)): Reject

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action. The Technical Correlating Committee agrees that the Exception is not necessary.

SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add an exception to read as follows:

Exception: Communications circuits, sound-recording and reproducing circuits, Class 2 and Class 3 circuits, and power-limited fire alarm circuits are covered by Articles 640, 725, 760 and 800.

SUBSTANTIATION: This section appears to literally apply to the wiring and equipment related to the articles noted in the proposal. Section 555-2 indicates those articles and this article apply. The problem is Section 555-7 which requires equipment grounding with an insulated minimum no. 12 conductor.
PANEL ACTION: Reject.
PANEL STATEMENT: The scope is under the jurisdiction of the TCC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #3646)

19- 137 - (555-2, FPN (New)): Accept in Principle
SUBMITTER: Philip A. Teah, Charles Industries
RECOMMENDATION: Add a new FPN to read:

"Specific information for Marinas and Boatyards can be found in the Fire Protection Standard for Marinas and Boatyards, NFPA 303."

SUBSTANTIATION: Many engineers and designers are unaware of the standard NFPA 303. This standard should be referenced just as it is in 555-3.
PANEL ACTION: Accept in Principle.
Proposal 19-135 picks up this proposal almost verbatim.
PANEL STATEMENT: Panel action on proposal 19-135 addresses this recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #523)

19- 138 - (555-3): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: In Section 555-3, replace "20 ft (6.1 m)" with "6.0 m (20 ft)" throughout.
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #3648)

19- 139 - (555-3): Reject
SUBMITTER: Philip A. Teah, Charles Industries
RECOMMENDATION: Where the second paragraph reads:

"Where shore power...shall be provided.", add to the last sentence of the second paragraph:

"Receptacles must supply only the type power as they are rated for."

SUBSTANTIATION: There is a misconception in the Marina industry that a receptacle rating is for the maximum voltage. For example, a receptacle marked as 125/250 is an acceptable receptacle for 208V; it is not.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation is covered in the existing 210-7 and 555-5.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #3762)

19- 140 - (555-3): Reject
SUBMITTER: Robert R. Kress, Charles Industries Marine Group
RECOMMENDATION: Add the following FPN at the end of the second paragraph. This is in addition to those at the end of the third paragraph:

FPN No. 1 For 120/208 single phase service derived from two legs of 120/208 volt 3-phase WYE service is in violation of the code since:

(a) It is impossible to achieve balance on an electrical distribution panel that is configured for 120/240 volts (single phase), resulting in the potential for overcurrent on the neutral (white) conductor and the potential for fire and
(b) Since suitable receptacles or inlets are not manufactured for this modified service.
SUBSTANTIATION: Numerous connections with burned neutral male elements clearly indicate the overcurrent found on the neutral conductor in "208" (single phase) supplied marinas when 125.250 volt boat inlets and cordset connectors to shoreside power pedestals are scrutinized.
It should be emphasized somewhere that single phase power derived from 120/208 volt, 3 phase WYE is potential fire hazard.
PANEL ACTION: Reject.
PANEL STATEMENT: A FPN should clarify a requirement not state a requirement. This requirement in the recommendation is addressed in the existing code (555-5).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #3645)

19- 141 - (555-4): Accept in Principle
SUBMITTER: Philip A. Teah, Charles Industries
RECOMMENDATION: Instead of: "be located within sight of the shore power connection", delete "within sight of" and replace with "next to".
SUBSTANTIATION: The new Manual of Style for NFPA Technical Committee Documents 2000 edition intent is to eliminate vague or unenforceable terms (see 2.2.2.3 and 2.2.2.4). The breaker should be at the point of connection to allow a quick response to the need to terminate power.
PANEL ACTION: Accept in Principle.
The text in Proposals 19-135, 555-17 (b) covers this recommendation.
PANEL STATEMENT: Proposal 19-135 addresses this recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #3761)

19- 142 - (555-4, FPN): Reject
SUBMITTER: Robert R. Kress, Charles Industries Marine Group
RECOMMENDATION: Revise text to read as follows:
FPN: "...3-wire loads <u>from</u> a 208Y/120 -volt, 3-wire source." and add:
"Suitable receptacles do not exist for modified 120/280 volt, 3-phase WYE, i.e., a single phase power source."
SUBSTANTIATION: Typographical error - replace "for" with "from".
PANEL ACTION: Reject.
PANEL STATEMENT: The reference should be to 555-5 not 555-4. Additionally, the typographical error mentioned has been corrected in the 1999 NEC. Also, there has been no technical substantiation submitted to support the recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #3647)

19- 143 - (555-5): Reject
SUBMITTER: Philip A. Teah, Charles Industries
RECOMMENDATION: Add a new second sentence to read as follows:
"120/208 branch circuits shall not be used to provide service to receptacles rated 125/250 volts single phase."
SUBSTANTIATION: When the panel added the FPN, they thought the FPN would address the problem of using inadequately rated receptacles. The industry is still using 125/250V rated receptacles supplied by 120/208 branch circuits. This stronger language is needed.
Note: Supporting Material is available for review at NFPA headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing 210-7(a) and 555-5 cover this recommendation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #358)

19- 144 - (555-6): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise:
FEEDERS AND SERVICES. <u>The computed load in volt-amperes for each receptacle shall be based on the receptacle current and voltage rating and number of phases (for example, a 30 ampere 208y/120 volt 3-phase receptacle shall be computed at not less than 10,800 volt-amperes).</u> The receptacle load for each feeder and /or service circuit that supplies shore power for boats shall be calculated as follows. These calculations may be modified as indicated in sections (a) and (b).

NUMBER OF RECEPTACLES (percent)	SUM of the RATING <u>in Volt- Amperes</u> of the RECEPTACLES
1-4	100
5-8	90
9-14	80
15-30	70
31-40	60
41-50	50
51-70	40
71-plus	30

(a) Where shore power accommodations provide <u>two or more</u> receptacles specifically for an individual boat slip and these receptacles have different ~~voltages~~ <u>ratings</u> ~~(for example, one 30 ampere 125 volt and one 50 ampere 125/250 volt),~~ only the receptacle with the larger ~~kilowatt demand~~ rating shall be required to be calculated.
(b) No change.
FPN: No change.
SUBSTANTIATION: The table and Section 555-3 indicate receptacle ratings are confined to amperes. No Code limitations re: voltage or phases is indicated. Calculation of load based solely on receptacle ampere rating without consideration of voltage and phases can result in a lower ampere rated receptacle that can supply greater load than one rated higher (20 ampere 208y/120 volt 3-phase = 7200 VA; 50 ampere 125 volt = 6250 VA). Determination of the larger kilowatt demand can vary dependent on the boat connected and equipment on-line at any one time. A fixed assigned load value per receptacle covers worst case (Maximum load) conditions.
More than two receptacles may be provided for a slip to provide for a variety of boat lengths and requirements. Present requirement of (a) only applies where two receptacles are provided and doesn't apply where the voltage ratings are the same, but ampere ratings are different.
PANEL ACTION: Reject.
PANEL STATEMENT: The existing text is sufficiently clear.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #4340)

19- 145 - (555-6): Reject
SUBMITTER: Leonard L. Johnson, Dept. of Insp, Licenses & Permits, Howard Cnty, MD
RECOMMENDATION: Revise text to read as follows:
"555-6. Feeders and Services. The load for each feeder and/or service <u>conductor</u> ~~circuit~~ supplying receptacles that supply...".
Remaining text remains as is.
SUBSTANTIATION: When calculating feeders and services the method has always been very specific for applying the demand factors of the "Number of Receptacles". The demand factor is based on the number of receptacles on a individual (single) service or feeder conductor. When the word "circuit" replaced the word "conductor" it became very confusing to many.
PANEL ACTION: Reject.
PANEL STATEMENT: The recommendation would change the text to the requirements of the previous edition which gave a method that resulted in over sizing the service.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9

VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #968)

19- 146 - (555-8(b) Exception No. 2 (New)): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Add an exception to read as follows:
Exception No. 2: Equipment grounding conductors larger than No. 6 shall be permitted to be identified by a durable and permanent green marking in accordance with Section 250-119(a).
SUBSTANTIATION: Larger than No. 6 conductors with green insulation are not always available. Provisions of Section 250-119(a) which are generally suitable for hazardous (classified) locations, hospitals, and other premises should be suitable for this article. Limitation to green marking (not stripping of insulation) would preserve conductor corrosion-resistance.
PANEL ACTION: Accept in Principle.
The Panel action on proposal 19-135 addresses the recommendation.
PANEL STATEMENT: The submitter's substantiation is accepted.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 9
VOTE ON PANEL ACTION:
AFFIRMATIVE: 9

(Log #1092)

19- 147 - (555-8(c)): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Change "No. 12" to "12 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
PANEL STATEMENT: The NEC Style Manual does not specify the language used one way or another. The NFPA Manual of Style seems to prefer 10AWG. Product standards use 10 AWG or 10 AWG 110-6 says that the conductor sizes are expressed in AWG or in circular mils so the AWG is implied The panel recognizes that the TCC may desire to take a different action to be consistent with the Code.

ARTICLE 600 — ELECTRIC SIGNS AND OUTLINE LIGHTING

(Log #550)

18- 71 - (600): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: a) Section 600-4(b): Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
b) Section 600-7: Replace "100 ft (30.5 m)" with "30 m (100 ft)"; Replace "2 in. (50.8 mm)" with "50 mm (2 in.)"; Replace "3/4 in. (19 mm)" with "19 mm (3/4 in.)"; Replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)"; Replace "1 3/4 in. (44.45 mm)" with "45 mm (1 3/4 in.)".
c) Section 600-8(c): Replace "0.020 in. (508 mm)" with "0.51 mm (0.020 in.)"; Replace "0.016 in. (406 mm) (No. 28 MSG)" with "0.41 mm (0.016 in.)".
d) Section 600-9(a): Replace "14 ft (4.4 m)" with "4.3 m (14 ft)".
e) Section 600-9(c): Replace "2 in. (50.8 mm)" with "50 mm (2 in.)".
f) Section 600-9(d): Replace "1/2 in. (12.7 mm)" with "13 mm (1/2 in.)"; Replace "1/4 in. (6.35 mm)" with "6 mm (1/4 in.)".
g) Section 600-10(c)(2): Replace "12 in. (305 mm)" with "300 mm (12 in.)".
h) Section 600-10(d)(2): Replace "15 ft (4.57 m)" with "4.5 m (15 ft)".
i) Section 600-21(d): Replace "3 ft (914 mm)" with "900 mm (3 ft)" in 3 locations.
j) Section 600-21(e): Replace "3 ft (914 mm)" with "900 mm (3 ft)" in 2 locations; Replace "2 ft (610 mm)" with "600 mm (2 ft)" in 2 locations; Replace "12 in. (305 mm)" with "300 mm (12 in.)".
k) Section 600-32(a): Replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)"; Replace "1 3/4 in. (44.45 mm)" with "45 mm (1 3/4 in.)".
l) Section 600-32(e): Replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)".
m) Section 600-32(g)(1): Replace "4 in. (102 mm)" with "100 mm (4 in.)".
n) Section 600-32(g)(2): Replace "2 1/2 in. (64 mm)" with "65 mm (2 1/2 in.)".
o) Section 600-32(j): Replace "20 ft (7 m)" with "6 m (20 ft)"; Replace "50 ft (15.2 m)" with "15 m (50 ft)".
p) Section 600-41(c): Replace "1/4 in. (6.5 mm)" with "6 mm (1/4 in.)".
q) Section 600-42(c): Replace "6 in. (152 mm)" with "150 mm (6 in.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept.

Note: The sequence no. 18-72 was not used.

(Log #2854)

18- 73 - (600-3): Reject
SUBMITTER: Bill F. Neitzel, Madison, WI
RECOMMENDATION: Add the following wording between the end of the first paragraph and subsection (a):
"Listing marks for all signs other than those described in parts (a) and (b) shall be visible from grade level after installation."
SUBSTANTIATION: Listing marks quite often are located out of sight for appearance sake. This practice raises questions about the listing of these signs. The listing marks are not obtrusive in appearance, and requiring them to be visible after installation benefits the owners, the supervising professionals, and the code officials. Call backs for verification of the listing marks cause increased costs to all parties.
PANEL ACTION: Reject.
PANEL STATEMENT: The visibility of the Listing mark sought is dependent on the orientation and installation of the sign and location of the observer. It is physically impractical in many instances to view the listing mark from the ground due to the size of the listing mark versus the physical location of the installed sign. For example a high rise pylon sign, or a sign mounted on the side of a building at a height of more than 2 stories. Nothing in the substantiation justified such a requirement.

(Log #CP1803)

18- 73b - (600-5(c)): Accept
SUBMITTER: CMP 18
RECOMMENDATION: Modify 600-5(c)(1) through (3) to read as follows:
"(c) Wiring Methods. Wiring methods used to supply signs shall comply with the following:
(1) Supply. The wiring method used to supply signs and outline lighting systems shall terminate within a sign, an outline lighting system enclosure, a suitable box, or a conduit body.
(2) Enclosures as Pull Boxes. Signs and transformer enclosures shall be permitted to be used as pull or junction boxes for conductors supplying other adjacent signs, outline lighting systems, or floodlights that are part of a sign, and shall be permitted to contain both branch and secondary circuit conductors.
(3) Metal poles. Metal poles used to support signs shall be permitted to enclose supply conductors, provided the poles and conductors are installed in accordance with Section 410-15(b)."
SUBSTANTIATION: Section revised conform to Style Manual Section 2.1.5 and 2.1.5.1.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3680)

18- 74 - (600-5(c)(4)and Exception (New)): Reject
SUBMITTER: Leonard F. Devine, Jr., W. Palm Beach County Bldg & Zoning, FL
RECOMMENDATION: Add a new paragraph (4) to read as follows:
(4) Conductors and neon tubing shall maintain a height of at least eight ft from the ground, and shall not be installed on walls where they can be reached from platforms, balconies, fire escapes or through windows, doors, or other similar openings. Neon below eight (8) ft shall be enclosed to prevent direct contact with neon tubing.
Exception : Where signs are totally enclosed so that ready accessibility is prevented and signs that totally insulate all connecting terminals, the eight foot height requirement shall not apply.
SUBSTANTIATION: By adding this new text it will add an extra measure of safety around neon, especially in areas of high public contact, such as restaurants, pubs, and sub shops.
PANEL ACTION: Reject.
PANEL STATEMENT: Paragraph 3-3.3 (d) of the NFPA Regulations Governing Committee Projects requires the submitter to provide "a statement of the problem and substantiation". This proposal contains neither.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1463)

18- 75 - (600-6(a)): Accept in Principle in Part
SUBMITTER: David B. Perry, City of Chattanooga, TN
RECOMMENDATION: Rewrite to read as follows:
a) Location shall be in accordance with either 1) or 2) below:
1) The disconnecting means shall be within sight of the sign or outline lighting it controls. Where the disconnecting means is not visible from the entire sign or outline lighting it shall be capable of being locked in the open position.
2) Signs or outline lighting systems operated by electronic or electromechanical controllers located external to the sign or outline lighting system shall be permitted to have a disconnecting means located within sight of the controller or in the same enclosure with the controller. The disconnecting means shall disconnect the sign from all ungrounded supply conductors. It shall be designed so that no pole can be operated independently and it shall be capable of being locked in the open position.
SUBSTANTIATION: This change will be cleaner and easier to read.
PANEL ACTION: Accept in Principle in Part.
Modify Section 600-6(a) to read as follows:
"(a) Location.
(1) Within sight of the sign. The disconnecting means shall be within sight of the sign or outline lighting system that it controls. Where the disconnecting means is out of the line of sight from any section that may be energized, the disconnecting means shall be capable of being locked in the open position.
(2) Within sight of the controller. The following shall apply for signs or outline lighting systems operated by electronic or electromechanical controllers located external to the sign or outline lighting system:
(a) The disconnecting means shall be permitted to be located within sight of the controller or in the same enclosure with the controller.
(b) The disconnecting means shall disconnect the sign or outline lighting system and the controller from all ungrounded supply conductors.
(c) The disconnecting means shall be designed so that no pole can be operated independently and shall be capable of being locked in the open position."
PANEL STATEMENT: The rearrangement proposed was accepted and editorially reformatted to conform with the Style Manual. The change in wording is rejected because no explanation of the problem or rationale for requiring visibility of the disconnect from the entire sign was given in the substantiation.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1093)

18- 76 - (600-7): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: Revise Article 600 as follows:
600-7 - change "No. 14" to "14 AWG"
600-31(b) - change "No. 18" to "18 AWG"
600-32(b) - change "No. 18" to "18 AWG".
SUBSTANTIATION: To provide consistency throughout the Code The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1763)

18- 77 - (600-7): Accept in Principle
SUBMITTER: Herbert Moulton, Masters Technology Inc.
RECOMMENDATION: Revise the second sentence of the first paragraph to read as follows:
600-7. Grounding. signs and metal equipment of outline lighting systems shall be grounded. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the ~~secondary wiring of a transformer or power supply for use with electrical discharge tubing shall be permitted as a bonding means in lengths not exceeding 100 ft (30.5 m)~~ secondary circuit conductors of a transformer or power supply shall not exceed 100 ft (30.5 m) total length in the secondary circuit where used as a bonding means.
Shall... Rest to remain as is.
SUBSTANTIATION: Confusion in the interpretation of the 100 foot requirement in this section seems to permit unlimited or 200 foot length of total flexible metal conduit. It appears that each high voltage terminal can have their own 100 foot length to comply with this section now.
UL tests have confirmed that the length be limited to 100 foot maximum in the secondary conductor circuit where used as a bonding means.
The way the section now reads allows an unlimited use of flexible metal conduit.
Also the flexible conduit cannot enclose the secondary wiring of a transformer or power supply. Only the enclosure that encloses the windings or parts of a power supply can enclose the secondary wiring or parts.
Flexible metal conduit can only enclose the secondary conductors not the wiring (windings) of the transformer or power supply.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: See panel action and statement on Proposal 18-78.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #2999)

18- 78 - (600-7): Accept in Principle

Note: The Technical Correlating Committee understands that the SI units will be as shown in Proposal 18-71.

SUBMITTER: Stephen G. Kieffer, Randall K. Wright, Kieffer & Co., Inc. / Wright Sign Co./Rep. Int'l Sign Assn.

RECOMMENDATION: Change format of 600-7 into subsections as follows:

600-7. Grounding. Signs and metal equipment of outline lighting systems shall be grounded.

(a) Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary wiring of a transformer or power supply for use with electric discharge tubing shall be permitted as a bonding means in lengths not exceeding 100 ft (30.5 m).

(b) Small metal parts not exceeding 2 in. (50.8 mm) in any dimension, not likely to be energized, and spaced at least 3/4 in. (19 mm) from neon tubing shall not require bonding.

(c) Where listed nonmetallic conduit is used to enclose the secondary wiring of a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 1 1/2 in. (38 mm) from the conduit when the circuit is operated at 100 Hz or less or 1 3/4 in. (44.45 mm) when the circuit is operated at over 100 Hz.

(d) Bonding conductors shall be copper and not smaller than No. 14.

(e) Metal parts of a building shall not be permitted as a grounded or equipment grounding conductor.

SUBSTANTIATION: Proposal improves readability of this complex section.

PANEL ACTION: Accept in Principle.

Revise 600-7 to read as follows:

"600-7. Grounding. Signs and metal equipment of outline lighting systems shall be grounded.

(a) Flexible metal conduit length. Listed flexible metal conduit or listed liquidtight flexible metal conduit that encloses the secondary circuit conductor from a transformer or power supply for use with electric discharge tubing shall be permitted as a bonding means if the total accumulative length of the conduit in the secondary circuit does not exceed 30.5 m (100 feet) .

(b) Small metal parts. Small metal parts not exceeding 50.8 mm (2 in.) in any dimension, not likely to be energized, and spaced at least 19 mm (3/4 in.) from neon tubing shall not require bonding.

(c) Nonmetallic conduit. Where listed nonmetallic conduit is used to enclose the secondary circuit conductor from a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 38 mm (1 1/2 in.) from the conduit when the circuit is operated at 100 Hz or less or 44.45 mm (1 3/4 in.) when the circuit is operated at over 100 Hz.

(d) Bonding conductors. Bonding conductors shall be copper and not smaller than 14 AWG.

(e) Metal building parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor.

FPN: Refer to 600-32(j) for restrictions on length of high-voltage secondary conductors."

PANEL STATEMENT: The section was revised as proposed and editorially rewritten to conform to the Manual of Style. The word "wiring" in (a) and (c) was changed to "conductors" because flexible metal conduit can only enclose the secondary conductors, not the wiring (windings) of the transformer or power supply. The wording was further revised to clarify that the length limitations apply to the conduit, not to the conductors.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3613)

18- 79 - (600-7): Accept in Principle

SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise text to read as follows:

600-7. Grounding. Signs and metal equipment of outline lighting systems shall be grounded. Listed flexible metal conduit or listed liquidtight metal conduit that encloses the ~~secondary wiring of a transformer or power supply for use with electric discharge tubing shall be permitted as a bonding means in lengths not exceeding 100 ft (30.5 m)~~ secondary circuit conductors of a transformer or power supply shall not exceed 100 ft (30.5 m) total length in the secondary circuit where used as a bonding means. Small metal parts not exceeding 2 in. (50.8 mm) in any dimension, not likely to be energized, and spaced at least 3/4 in. (19 mm) from neon tubing shall not require bonding. Where listed nonmetallic conduit is used to enclosure the secondary wiring of a transformer or power supply and a bonding conductor is required, the bonding conductor shall be installed separate and remote from the nonmetallic conduit and be spaced at least 1 1/2 in. (38 mm) from the conduit when the circuit is operated at 100 Hz or less or 1 3/4 in. (44.45 mm) when the circuit is operated at over 100 Hz. Bonding conductors shall be copper and not smaller than No. 14. Metal parts of a building shall not be permitted as a grounded or equipment grounding conductor.

FPN: Refer to Section 600-32(j) for additional restrictions on length of high-voltage secondary conductors.

SUBSTANTIATION: Confusion in the interpretation of the 100 ft requirement in this section seems to permit unlimited or at least 200 ft lengths of total flexible metal conduit. It appears that each high voltage terminal can have their own 100 ft length to comply with this section now. UL tests have confirmed that the total length needs to be limited to 100 ft maximum in the secondary conductor circuit where used as a bonding means. The way the section now reads allows an unlimited use of flexible metal conduit. Also the flexible conduit cannot enclosure the secondary wiring of a transformer power supply. Only the enclosure that encloses the windings or parts of a power supply can enclose the secondary wiring or parts. Flexible metal conduit can only enclose the secondary conductors not the wiring (windings) of the transformer or power supply.

PANEL ACTION: Accept in Principle.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

COCHRAN: I support the panel action but believe there is still a need to clarify the use, application, and length of raceways for secondary conductor circuits. The proposed change is needed to clarify the intent of the code and make it more user friendly.

(Log #4249)

18- 80 - (600-7): Accept in Principle

SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee

RECOMMENDATION: Add the following as a second paragraph:

Signs or outline lighting installed inside a fountain shall have all metal parts and equipment grounding con-ductors bonded to the equipment grounding conductor for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain, and shall be permitted to be made to metal piping systems that are bonded in accordance with Section 680-53.

SUBSTANTIATION: This proposal relieves a direct conflict in the 1999 NEC. Section 600-7 was supposed to contain a bonding requirement as shown in the first sentence of this proposal (Proposal 18-102). Section 680-57(e) points to the bonding requirement supposedly in this section. However, CMP 18 forgot they included the requirement when they acted on public comments. Comment 18-89 inadvertently wiped out the requirement while the panel was making other changes to this section. The result is an important safety requirement lost because Section 690-57(e) now points to a nonexistent bonding requirement. Unfortunately the Correlating Committee completely missed this as well.

This wording improves on the CMP 18 wording in the proposal period because it specifies that the equip-ment grounding conductor being bonded to is the one for the recirculation system, which the CMP 18 word-ing would have left in doubt. The recirculation system would have the principal grounding conductor. The second sentence completes the rule with a location requirement. Since the point of the requirement is the elimination of local potential differentials, the connection should be close if possible. In addition, local metal piping systems, where bonded per Code, can be a practical way of achieving a close connection.

PANEL ACTION: Accept in Principle.

Add the following as item (f) to Section 600-7:

"(f) Signs in fountains. Signs or outline lighting installed inside a fountain shall have all metal parts and equipment grounding conductors bonded to the equipment grounding conductor for the fountain recirculating system. The bonding connection shall be as near as practicable to the fountain, and shall be permitted to be

made to metal piping systems that are bonded in accordance with Section 680-53."
PANEL STATEMENT: The proposal was modified to conform with the NEC Style Manual and rearrangement of Section 600-7 as adopted in Proposal 18-78. This requirement was inadvertently left out of the 1999 NEC.

(Log #970)

18- 81 - (600-10(d)(1)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Cords shall be SP-2, SPE-2, SPT-2, ~~or heavier~~ junior hard service or hard service types, as designated in Table 400-4.
SUBSTANTIATION: Editorial. The proposal is intended to clarify what "heavier" (a vague term) is apparently intended to mean.
PANEL ACTION: Reject.
PANEL STATEMENT: The current wording of 600-10(d) permits any cord heavier than SP2. The proposed wording eliminates types of cords presently acceptable that are not junior hard service such as SPT-3 and SVT. No technical rationale was presented to support this change.

(Log #2795)

18- 82 - (600-21(e) and (f)): Reject
SUBMITTER: Phillip David Martin, City of Chattanooga, TN/Rep. Public Works-Insp. Div, Chattanooga, TN
RECOMMENDATION: Combine (e) and (f):
Attic locations and suspended ceilings to include the same requirements of the 1999 code but include the phrase "A switched lighting outlet be installed in any space where sign transformer or ballast are installed or serviced."
SUBSTANTIATION: Attics with sign transformers are usually installed in spaces with little or not light in the working space and the transformers are usually high-voltage transformers.
PANEL ACTION: Reject.
PANEL STATEMENT: No technical substantiation was provided to support the proposed combination of (e) and (f). No technical substantiation was provided for adding a lighting outlet requirement in a soffit or above a suspended ceiling. The requirement for a lighting outlet in attics already exists in 210-70(c).

(Log #45)

18- 85 - (600-23(b)): Reject
NOTE: The following proposal consists of Comment 18-97 on Proposal 18-117 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 18-117 was:
Revise as follows:
600-23. Transformers and Electronic Power Supplies.
(a) Type. Transformers and electronic power supplies shall be identified for the use and shall be listed.
(b) Secondary Circuit Fault Protection. Transformers and electronic power supplies other than the following shall have secondary circuit ground-fault protection.
~~Exception No.~~ (1) Transformers with isolated secondaries and with a maximum open circuit voltage of 7500 volts or less ~~need not have secondary ground fault protection.~~
Exception No.(2) Transformers with integral porcelain or glass secondary housing for the neon tubing and requiring no field wiring ~~on~~ of the secondary circuit ~~shall not be required to have secondary ground fault protection.~~
(c) Voltage. Secondary circuit voltage shall not exceed 15,000 volts, nominal, under any load condition. The voltage to ground of any output terminals of the secondary circuit shall not exceed 7500 volts, under any load conditions.
(d) Rating. Transformers and electronic power supplies shall have a secondary circuit current rating of not more than 300 milliamperes.
(e) Secondary Connections. Secondary circuit outputs shall not be connected in parallel or in series.
SUBMITTER: Thomas E. Trainor, City of San Diego, CA
RECOMMENDATION: This proposal was intended to clarify the requirements for secondary fault protection. This comment continues that effort by making the text in Subsection (b) consistent with the title of the Subsection and describing what secondary fault protection is intended to accomplish.
Revise Section 600-23 (b) to read as follows:
(b) Secondary Circuit Fault Protection. Transformers and electronic power supplies other than the following shall have secondary circuit ~~ground~~fault protection.
(1) Transformers with isolated secondaries and with a maximum open circuit voltage of 7500 volts or less.
(2) Transformers with integral porcelain or glass secondary housing for the neon tubing and requiring no field wiring of the secondary circuit.
The protective device shall deenergize the secondary circuit under any of the following conditions:

(1) When the secondary circuit faults to ground;
(2) When there is in-line arcing or excessive current on the secondary circuit;
(3) When there is an open circuit in the secondary caused by a break in the tubing or wiring.
The protective device shall respond to these conditions within 10 seconds, shall have a manual reset and shall also be permitted to incorporate an automatic resetting feature that operates a maximum of 3 times before requiring manual resetting.
SUBSTANTIATION: This proposed revision clearly describes the expectations for secondary fault protection as they were discussed in the 1996 code cycle. Evidently, the work of the transformer manufacturer's and test labs to date has resulted in a secondary protector that only senses faults to ground. These protectors do not sense in-line arcing , excessive current flow or open circuit conditions. All of these conditions represent serious fire and shock hazards. Protection against these conditions was considered to be a part of the requirement for secondary fault protection in the original panel discussions. The technology clearly exists to provide this type of secondary protection and anything less simply does not effectively provide the level of safety required for neon installations.
PANEL ACTION: Reject.
PANEL STATEMENT: No technical substantiation or fire safety data is provided to support the requirement for open circuit protection. The transformers used in neon tubing circuits are current limiting devices. The panel is not aware of any conditions where in-line arcing without a ground fault resulted in a fire. The product standard has required the secondary circuit ground fault protection since September 1999. The last paragraph of the proposal contains requirements that may be more appropriate for the product standard. For example: A 10 second time delay might result in a fire.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3614)

18- 88 - (600-32): Accept in Principle in Part
SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors
RECOMMENDATION: Revise text to read as follows:
600-32. Neon Secondary Circuit Conductors, Over 1000 Volts, Nominal. (a) Wiring ~~Method.~~ Methods. Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for the purpose. Wiring methods shall be installed in accordance with the requirements of Chapter 3. Only one secondary circuit conductor shall be installed ~~per length~~ in 1/2 in. or larger ~~of~~ conduit or tubing. Nonmetallic conduit or flexible nonmetallic conduit, when operated at 100 Hz or less, shall be spaced at least 1 1/2 in. (38 mm) from grounded or bonded parts; and, when operated at over 100 Hz, shall be spaced at least 1 3/4 in (44.45 mm) from grounded or bonded parts. Metal parts of a building shall not be used as a grounded or equipment grounding conductor.
SUBSTANTIATION: As written this section leads to confusion in the fact that Chapter 3 requires 1/2 in. minimum for conduit and tubing be installed for Article 600. Inspectors are confused as to what equipment constitutes allowing 3/8 in. flexible metal conduit. Present wiring methods which utilize the installation of a cable known GTO cable. Various types of GTO cable will over fill a 3/8 in. flexible metal conduit and leads to insulation deterioration of the cable. This is created by the electrostatic fields generated by the high voltages in relationship to the close proximity to the ground plane of the conduit being grounded. Servicing signs and outline lighting where this is smaller diameter conduits have been installed reinforces the requirement as proposed.
Example, Section 350-10(a)(2) allows 3/8 in. flexible metal conduit for utilization equipment. Inspectors and installers are confused since Article 600 does not address the minimum size conduit or tubing allowed for the installation of the high voltage secondary circuit conductors. Revising this sentence will clarify this requirement. Also please note that Article 490 is also silent on this requirement.
PANEL ACTION: Accept in Principle in Part.
The panel accepts the change from "method" to "methods". The panel accepts the clarification of 1/2" conduit or tubing as the minimum acceptable size. The panel rejects the addition of "secondary circuit". See panel action on Proposal 18-91.
PANEL STATEMENT: The panel accepts the change from "method" to "methods". The panel accepts the clarification of 1/2" conduit or tubing as the minimum acceptable size. See panel action and statement on Proposal 18-91. The panel rejects the addition of "secondary circuit". This wording would have permitted the installation of other conductors, such as branch circuit conductors, in conduit with the secondary circuit conductor.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
COMMENT ON AFFIRMATIVE:
COCHRAN: I support the panel action but believe there is still a need for clarification concerning the possibility of installing two or more secondary conductors in a secondary circuit raceway. This section needs further text clarification to achieve that objective and should be addressed during the comment stage.

(Log #46)

18- 89 - (600-32(a)): Reject
NOTE: The following proposal consists of Comment 18-116 on Proposal 18-124 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 18-124 was:
Delete: "RIGID NONMETALLIC CONDUIT", 'LIQUID TIGHT FLEXIBLE NONMETALLIC CONDUIT", "ELECTRICAL NONMETALLIC TUBING".
Exception No. 1: Rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, electrical nonmetallic tubing may be used in dry locations with electronic power supplies, where listed for the purpose.
SUBMITTER: Charles W. Forsberg, Lamson & Sessions
RECOMMENDATION: 1. Continue to delete the nonmetallic raceways per the panel action.
2. Add an Exception to read:

Exception: Rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, and electrical nonmetallic tubing shall be permitted where the secondary conductors are installed in listed nonmetallic sign tubing.

SUBSTANTIATION: If the Panel does not accept my companion comment to reject this proposal, this comment is intended to add an additional level of safety that will permit the nonmetallic raceways to be used in this application. The combination of the listed nonmetallic sign tubing and the wall of the nonmetallic raceway will adequately contain any corona that is generated from deteriorated GTO cable.

Acceptance of this comment will provide a safe wiring means while evaluation and testing can be conducted to determine the accurate source of the sign problem so that specific proposals can be submitted for the 2002 NEC.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter provided no technical substantiation to support this change.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1759)

18- 90 - (600-32(a)): Accept in Principle in Part

SUBMITTER: Herbert Moulton, Masters Technology Inc.

RECOMMENDATION: Revise the title and third sentence of the first paragraph to read as follows:

(a) Wiring ~~method~~ methods. Conductors ... to remain ... wiring... to remain. Only one secondary circuit conductor shall be installed ~~per length of~~ in 1/2 in. or larger conduit or tubing.

Nonmetallic ...rest to remain as is.

SUBSTANTIATION: As written this section leads to confusion in the fact that Chapter 3 requires 1/2 inch minimum for conduit and tubing be installed for Article 600. Inspectors are confused as to what equipment constitutes allowing 3/8 inch flexible metal conduit.

Present wiring methods which utilize the installation of a cable know GTO cable. Various types of GTO cable will overfill a 3/8 inch flexible metal conduit and leads to insulation deterioration of the cable. This is created by the electrostatic fields generated by the high voltages in relationship to the close proximity to the ground plane of the conduit being grounded.

Servicing signs and outline lighting where this smaller diameter conduits have been installed reinforces this requirement as proposed.

Example, Section 350-10(a)(2) allows 3/8 inch flexible metal conduit for utilization equipment. Inspectors and installers are confused since Article 600 does not address the minimum size conduit or tubing allowed for the installation of the high voltage secondary circuit conductors.

Revising this sentence will clarify this requirement.

Also, please note that Article 490 is also silent on this requirement.

PANEL ACTION: Accept in Principle in Part.

PANEL STATEMENT: See panel action and statement on Proposal 18-88.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

AFFIRMATIVE: 11

(Log #3000)

18- 91 - (600-32(a)): Accept in Principle

Note: The Technical Correlating Committee understands that the SI units will be as shown in Proposal 18-71.

SUBMITTER: Stephen G. Kieffer, Randall K. Wright, Kieffer & Co., Inc. / Wright Sign Co./Rep. Int'l Sign Assn.

RECOMMENDATION: Change format of 600-32(a) into subsections and revise subpart iv as follows:

600-32. Neon Secondary Circuit Conductors, Over 1000 Volts, Nominal.

(a) Wiring Method.

(i) Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for the purpose.

(ii) Wiring methods shall be installed in accordance with the requirements of Chapter 3.

(iii) Only one conductor shall be installed per length of conduit or tubing.

(iv) Other than at the location of connection to a metal enclosure or sign body, nonmetallic conduit or flexible nonmetallic conduit, ~~when operated at 100 Hz or less,~~ shall be spaced at least 1 1/2 in. (38 mm) from grounded or bonded parts when the conduit contains a conductor operating at 100 Hz or less; and~~, when operated at over 100 Hz,~~ shall be spaced at least 1 3/4 in. (44.45 mm) from grounded or bonded parts when the conduit contains a conductor operating at over 100 Hz.

(v) Metal parts of a building shall not be used as a grounded or equipment grounding conductor.

SUBSTANTIATION: Proposal improves readability of this complex section and corrects improper English usage in subpart iv.

The additional wording in the subpart is added to make it clear that spacing must occur at all times, except where the nonmetallic is connected to a sign.

PANEL ACTION: Accept in Principle.

Modify and reformat 600-32(a) into subsections and revise subpart iv as follows:

"600-32. Neon Secondary Circuit Conductors, Over 1000 Volts, Nominal.

(a) Wiring Methods.

(1) Installation. Conductors shall be installed on insulators, in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, flexible metal conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for the purpose and shall be installed in accordance with the requirements of Chapter 3.

(2) Number of conductors. Conduit or tubing shall contain only one conductor.

(3) Size. Conduit or tubing shall be minimum 1/2" electrical trade size.

(4) Spacing from ground. Other than at the location of connection to a metal enclosure or sign body, nonmetallic conduit or flexible nonmetallic conduit shall be spaced no less than 38 mm (1 1/2 in.) from grounded or bonded parts when the conduit contains a conductor operating at 100 Hz or less; and shall be spaced no less than 44.45 mm (1 3/4 in.) from grounded or bonded parts when the conduit contains a conductor operating at more than 100 Hz.

(5) Metal building parts. Metal parts of a building shall not be permitted as a secondary return conductor or an equipment grounding conductor."

PANEL STATEMENT: Specific wording was added to clarify that 1/2" trade size conduit or tubing is the minimum acceptable size for enclosing a secondary conductor. The wording was modified to conform with the style manual.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3742)

18- 92 - (600-32(a)): Reject

SUBMITTER: Donald W. Shields, Town of Normal, IL

RECOMMENDATION: Delete the words "on insulators" from the first sentence to read:

"Conductors shall be installed in rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, liquidtight flexible metal conduit, electrical metallic tubing, metal enclosures, or other equipment listed for the purpose."

SUBSTANTIATION: The words "on insulators" is pervasive and confusing, which can and does lead to improper installations. GTO is required to be installed in a raceway or other equipment listed for the purpose. The use of insulators for installation would be covered in the UL 48 sign standard as a listed unit, not a field installation.

PANEL ACTION: Reject.

PANEL STATEMENT: Insufficient substantiation was submitted for the panel to define the specific parameters of the problem. Further, the proposal lacked specific wording necessary to address the concerns of the submitter.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

COCHRAN: GTO is evaluated under the UL 814 Standard. That standard does not evaluate GTO to be used as a stand-alone conductor. It is required to be installed inside of a listed raceway,

sign enclosure, or sign body. Either the raceway or enclosure provides the required physical protection from wet environments, abrasion and physical damage. GTO installed upon insulators outside of a listed sign body or enclosure violates the principles of safe wiring practice and the fundamental applications of the National Electrical Code. A past practice of wiring in this manner is not a license to continue and cause a condition of either electrical shock or potential for fire. This is an issue of safety.

(Log #3784)

18- 93 - (600-32(a)): Reject
SUBMITTER: Jeffrey Peters, Young Electric Sign Co.
RECOMMENDATION: Deleted text.
"...rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit,..."
"Nonmetallic conduit or flexible nonmetallic conduit, when operated at 100Hz or less, shall be spaced at least 1 1/2 in. (38mm) from grounded or bonded parts; and, when operated at over 100 Hz, shall be spaced at least 1 3/4 in. (44.45mm) from grounded or bonded parts."
SUBSTANTIATION: The deletion of this text would eliminate the confusion caused by the statement, also in 600-32(a), that "Wiring methods shall be installed in accordance with the requirements of Chapter 3." The use of high voltage cable in nonmetallic conduits is restricted by article 331-4(6).
In the field, I have seen the charring of nonmetallic conduit when moisture from condensation (or otherwise) has come in contact with the high voltage cable.
Also, the spacing of the nonmetallic conduit from grounded or bonded parts makes it difficult, if not impossible, to use.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter provided no technical substantiation. While providing anecdotal information, the substantiation did not contain any documentation demonstrating problems with code compliant installations.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4250)

18- 94 - (600-32(a)): Reject
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Delete "liquidtight flexible nonmetallic conduit" from the body of the rule (two places). Delete "on insulators" from the rule.
Add the following two exceptions:
Exception No. 1: Liquidtight flexible nonmetallic conduit shall be permitted at terminations where flexibility is required. The conduit shall be arranged or secured to assure, on a continuing basis, the same spacing from grounded or bonded objects as would otherwise apply to rigid nonmetallic conduit.
Exception No. 2: Open wiring on insulators shall be permitted at terminations.
SUBSTANTIATION: After much controversy, CMP 18 removed ENT as an allowable wiring method due to its likelihood of sagging over time and not maintaining the required spacings to grounded objects. Fair enough. However, the panel failed to apply the same reasoning to liquidtight flexible nonmetallic conduit, a wiring method with the word "flexible" right in its name. If ENT will sag, LTFNC will sag much more. This proposal allows for limited usage of the flexible product at terminations, with appropriate restrictions.
The proposal also addresses the issue of open wiring on insulators. The opening language of this section is an open invitation to run the GTO exposed above a hung ceiling for indefinite distances. I have seen this done in the field. In numerous seminars, representatives of the sign industry have expressed the opinion that this should only be done at the neon tubing termination, and not in lieu of a recognized wiring method. This proposal provides the appropriate framework for the panel to revisit this issue.
PANEL ACTION: Reject.
PANEL STATEMENT: Flexibility is required in the majority of installations of neon secondary circuit conductors. As the proposal or substantiation does not address what constitutes the need for flexibility, the use of liquidtight flexible nonmetallic conduit should be permitted as in the present code rather than by exception. It is understood per the existing text that the required spacings from grounded or bonded parts must be maintained over the length of the secondary circuit conductors. No substantiation was provided to indicate that liquidtight flexible nonmetallic conduit installed in accordance with 351-27 and 600-32(a) is unsatisfactory.
Insufficient substantiation was submitted for the panel to define the specific parameters of the problem with respect to GTO cable installed on insulators.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #1760)

18- 95 - (600-32(b)): Reject
SUBMITTER: Herbert Moulton, Masters Technology Inc.
RECOMMENDATION: Delete original text and replace section with this revised test to read as follows:
(b) Insulation and Size. Secondary conductors shall be Type GTO cable, listed for the purpose, rated for the voltage, not smaller than No. 14 AWG, and have a minimum temperature rating of 115 degree centigrade.
Exception: Where the secondary conductors do not come in contact with the neon tube electrode, the minimum temperature shall be permitted to 105 degrees centigrade.
SUBSTANTIATION: Field installations using No. 18 AWG size Type GTO cable has demonstrated failure to the insulation of the cable due to the concentrated electrostatic field generated by the smaller diameter of the No. 18 AWG wire as opposed to the larger outside diameter of the original required No. 14 AWG as required in the 1993 and previous codes.
Due to the development of newer insulating materials, the flexibility concerns of the code panel during 1996 and 1999 has been addressed by the manufacturers.
Transformer manufacturers and neon electrode manufacturers have verified with tests that the temperature at the electrodes of the tubes can exceed 105 degrees centigrade. The enclosures both glass and polymeric, in most installations, require the Type GTO cable to come in contact with the neon tube electrode.
Note: Supporting Material is available for review at NFPA headquarters.
PANEL ACTION: Reject.
PANEL STATEMENT: In reference to the increased size of the conductor, the substantiation does not support the proposal, as it does not indicate if other installation requirements were in accordance with the Code in those installations demonstrating unacceptable performance of the secondary circuit conductors. From review of the 1995 Committee Report on Proposals for the 1996 Code, flexibility was only one issue relating to the change to 18 AWG minimum conductors. As the submitter indicates, insulating materials have been enhanced. These enhancements not only address the flexibility issue but also address protection of the conductors from physical abuse as noted in the substantiation statement included in the 1995 Committee Report. As the conductors shall be listed for the purpose, further enhancements to these insulating materials may have occurred in order to comply with the revised requirements per the 1999 revisions to the nationally recognized standard for gas-tube-sign cable that became effective on August 1, 1999. In reference to the increase in temperature rating of the conductor, the substantiation does not support the proposal. Only two temperatures over 105 degrees C were noted in the material provided with the proposal. However, no details of the test method were included in the documentation. The statement "Temperatures above 105 degrees C can be used as an indication for a quality problem or overload of the electrode" included in the material is indicative of an improper installation or use, not an indication of a need to raise the minimum temperature rating of the conductor.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

COCHRAN: There needs to be corrections to the installation types, size and ratings of secondary conductors.

(Log #1761)

18- 97 - (600-32(e)): Accept in Part

SUBMITTER: Herbert Moulton, Masters Technology Inc.

RECOMMENDATION: Revise this section to read as follows:

(e) Spacing. Secondary conductors shall be separated from each other and from all objects other than insulators or neon tubing by a spacing of not less than 1 1/2 in. (38 mm). GTO cable installed in metal conduit or tubing ~~requires no spacing between the cable insulation and the conduit or tubing.~~ shall be required to have an insulating sleeving where the secondary conductor voltage is 3750 volts or more.

SUBSTANTIATION: Tests conducted at the request of UL and sign manufacturers have shown that damage to the Type GTO cable is evident over time and not evident when this cable is first installed.

Testing has also shown that the ozone generated due to this value of voltage creates extreme damage over time. By placing an insulating tubing or sleeving over the cable within the conduit or tubing will prevent the cable from being in contact with the grounding plane created by the conduit or tubing. This added sleeving also helps keep the electrostatic field more centered within the conduit or tubing thereby reducing the point stresses on the insulation of the cable.

Also, at present, UL standard 814 has no requirement for testing of Type GTO cable within flexible metal conduit. Thereby, the condition as referenced by this code change would not be evident by the requirements in UL Standard 814.

Note: Supporting Material is available for review at NFPA headquarters.

PANEL ACTION: Accept in Part.

The panel accepts the addition of the word "secondary" and rejects the remainder of the recommendation.

The panel modified (e) to read "Spacing. Conductors shall be separated from each other and from all objects other than insulators or neon tubing by a spacing of not less than 1 38 mm (1/2 in.)."

PANEL STATEMENT: The code does not presently prohibit the use of sleeving. The documentation did not substantiate requiring the use of sleeving. The nationally recognized standard for gas-tube-sign cable, identified as type GTO cable, was revised to include ozone exposure testing to address field reports of degradation of the cable insulation due to ozone. This revision became effective August 1, 1999. The substantiation does not indicate that cable listed to this revised standard, and thus meeting the requirements for the ozone exposure testing, would need the additional insulating sleeving.

The panel modified (e) to conform with the Style Manual.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #3616)

18- 98 - (600-32(e)): Accept in Part

SUBMITTER: Philip H. Cox, Int'l Assn. of Electrical Inspectors

RECOMMENDATION: Revise text to read as follows:

600-32. Neon Secondary Circuit Conductors, Over 1000 Volts, Nominal.

(e) Spacing. Secondary c~~C~~onductors shall be separated from each other and from all objects other than insulators or neon tubing by a spacing of not less than 1 1/2 in. (38 mm). GTO cable installed in metal conduit or tubing ~~requires no spacing between the cable insulation and the conduit or tubing.~~ shall be required to have listed insulating sleeving where the secondary conductor voltage is 3750 volts or more to ground.

SUBSTANTIATION: Tests conducted at the request of UL and Sign Manufacturers have shown that damage to the Type GTO cable is evident over time and NOT evident when this cable is first installed. Testing has also shown that the Ozone generated due to the value of voltage creates extreme damage over time. By placing an insulation tubing or sleeving over the cable within the conduit or tubing will prevent the cable from being in contact with the grounding plane created by the conduit or tubing. This added sleeving also helps keep the electrostatic field more centered within the conduit or tubing thereby reducing the point stresses on the insulation of the cable.

Also at present, UL standard 814 has no requirement for testing of Type GTO cable within flexible metal conduit. Thereby the condition as referenced by this code change would not be evident by the requirements in UL 814.

PANEL ACTION: Accept in Part.

The panel accepts the addition of the word "secondary" and rejects the remainder of the recommendation.

Also modify in (e)"1 1/2 in. (38 mm)" to "38mm (1 1/2 in.)"

PANEL STATEMENT: The submitter provided no technical substantiation to support this change. See panel statement for Proposal 18-97. Modified (e) to conform with style manual.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

COMMENT ON AFFIRMATIVE:

COCHRAN: I support the panel action but believe the additional use of the material would contribute to a safer installation.

(Log #3001)

18- 99 - (600-32(h)): Accept in Principle

SUBMITTER: Stephen G. Kieffer, Randall K. Wright, Kieffer & Co., Inc. / Wright Sign Co./Rep. Int'l Sign Assn.

RECOMMENDATION: Revise text deleting incorrect terminology "mid-point ground", replacing it with the terminology "mid-point return". Delete the sentence addressing length restrictions, see ISA proposal for 600-32(j).

(h) Between Neon Tubing and ~~Grounded~~ Midpoint Return. Conductors shall be permitted to run ~~from~~ between the ends of neon tubing or to the ~~grounded~~ secondary circuit midpoint return of transformers or electronic power supplies listed for the purpose and provided with terminals at the midpoint. ~~Where such connections are made to the grounded midpoint, the connections between the high voltage terminals and the line ends of the neon tubing shall be as short as possible.~~

SUBSTANTIATION: The mid-point return is part of the high voltage secondary circuit. The secondary mid-point is not always referenced to ground. The historic use of the term mid-point ground has cause this terminal to be confused with equipment grounding and has resulted in incorrect wiring practices. Changing the code to delete the term ground will help eliminate this confusion.

The second sentence has been deleted. This is a length restriction which should be placed in 600-32(j). See ISA's proposal for that subsection.

PANEL ACTION: Accept in Principle.

Modify to revise text as follows:

"(h) Between Neon Tubing and Midpoint Return. Conductors shall be permitted to run between the ends of neon tubing or to the secondary circuit midpoint return of transformers or electronic power supplies listed for the purpose and provided with terminals at the midpoint."

PANEL STATEMENT: The panel made editorial revisions to the text.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

(Log #1762)

18- 100 - (600-32(j)): Accept in Principle
SUBMITTER: Herbert Moulton, Masters Technology Inc.
RECOMMENDATION: Revise the title and section to read as follows:
(j) Length of ~~High Voltage Cable~~ Secondary Circuit Conductor. Not more than 20 ft (7 m) of ~~high voltage cable~~ secondary circuit conductor shall be permitted in metal conduit or tubing from a high-voltage terminal of a transformer/power supply to the first neon tube electrode. Not more than ~~50 ft (15.2 m)~~ 20 ft (7 m) of high-voltage cable shall be permitted in nonmetallic conduit from a high-voltage terminal of a transformer/power supply to the first neon tube electrode.
SUBSTANTIATION: Change title to reflect the main topic as stated in 600-32.
By allowing the nonmetallic conduit to be installed in 50 foot lengths creates additional resistance and capacitance creating additional load on the transformer and/or power supply.
This causes the transformer and/or power supply to fail prematurely or may overheat to create a fire potential.
PANEL ACTION: Accept in Principle.
See panel action in Proposal 18-101.
PANEL STATEMENT: The panel accepts the concept of the length limitations, with the exception of the limitation of 20 feet for nonmetallic conduit. The submitter provided no technical substantiation for this change. See Proposal 18-101 and the panel action and statement.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3002)

18- 101 - (600-32(j)): Accept in Principle
SUBMITTER: Stephen G. Kieffer, Randall K. Wright, Kieffer & Co., Inc. / Wright Sign Co./Rep. Int'l Sign Assn.
RECOMMENDATION: Revised section to limit metal conduit length when 30 ma transformers or power supplies are used. Section will read as follows:
(j) Length of High-Voltage Cable.
(i) Not more than 10 ft (7 m) of high-voltage cable shall be permitted in metal conduit or tubing from a high-voltage terminal to the first neon tube of a transformer/power supply rated 45 ma or less.
(ii) Not more than 20 ft (7 m) of high-voltage cable shall be permitted in metal conduit or tubing from a high-voltage terminal to the first neon tube of a transformer/power supply rated greater than 45 ma.
(iii) Not more than 50 ft (15.2 m) of high-voltage cable shall be permitted in nonmetallic conduit from a high-voltage terminal to the first neon tube of a transformer/power supply.
(iv) All other sections of high voltage cable in a neon tubing circuit shall be as short as practicable.
SUBSTANTIATION: Test data has proven that excessive capacitive coupling occurs with 30 ma transformers, neon tubing and longer lengths of GTO in conduit, resulting in excessive electrostatic fields, the potential production of ozone and potential destruction of the transformer and conductor. 60 ma transformers do not exhibit these characteristics. A 45 ma restriction was selected as a likely decision point and to avoid the production of transformers rated only slightly higher than 30 ma in order to avoid this restriction. Transformers rated 45 ma are not presently available for testing. Oscilloscope displays documenting these tests are provided.
Subpart (iv) has been added to address all the other lengths of GTO in conduit which are part of the secondary circuit. Although not as critical as the run to the first tube, due to voltage drops, every length of conduct in conduct does add capacitance to the total system.
In addition, a proposed restructuring of the section is presented for readability.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept in Principle.
Modify the text to read as follows:
"(j)Length of Secondary Circuit Conductors .
(1)Secondary conductor to the first electrode. The length of secondary circuit conductors from a high voltage terminal of a transformer or electronic power supply to the first neon tube electrode shall not exceed:
(a) 3m (10 feet) when installed in metal conduit or tubing for a transformer or electronic power supply rated 45 ma or less.
(b) 6m (20 feet) when installed in metal conduit or tubing for a transformer or electronic power supply rated greater than 45 ma.
(c) 15m (50 feet) when installed in nonmetallic conduit.
(2) Other secondary circuit conductors. All other sections of secondary circuit conductor in a neon tube circuit shall be as short as practicable."
PANEL STATEMENT: The panel accepts the proposed limitations of the length of secondary circuit conductors. The text has been editorially revised to conform with the style manual.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11

COMMENT ON AFFIRMATIVE:
COCHRAN: I support the panel action but believe the change in wording would lead to a cleaner and more understandable text as well as a safer installation.

(Log #3785)

18- 103 - (600-32(j)): Reject
SUBMITTER: Jeffrey Peters, Young Electric Sign Co.
RECOMMENDATION: Deleted text.
"Not more than 50 ft (15.2 m) of high-voltage cable shall be permitted in nonmetallic conduit from a high-voltage terminal of a transformer/power supply to the first neon tube."
SUBSTANTIATION: The deletion of this text would eliminate the confusion caused by article 331-4(6), which restricts the use of high voltage cable in nonmetallic conduits.
In the field I have seen the charring of nonmetallic conduit when moisture from condensation (or otherwise) has come in contact with the high voltage cable.
Also, the spacing of the nonmetallic conduit from grounded or bonded parts makes it difficult, if not impossible, to use.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter provided no technical substantiation to delete the use of nonmetallic conduit. There should be no confusion with 331-4(6) because electrical nonmetallic tubing is not permitted in Article 600.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #4443)

18- 104 - (600-32(j)): Reject
SUBMITTER: Tom Edwards
RECOMMENDATION: Revise as follows:
Not more than 20 ft of high voltage cable.
Change the 50 ft to 20 ft.
SUBSTANTIATION: A 15,000 volt transformer, that's 7500 volts each secondary leg, with 20 ft leads will short out time after time. Distance traveled creates heat there for a short occurs. At 12 ft leads on each leg this does not happen.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel assumes that the submitter was referring to nonmetallic conduit. The submitter provided no technical substantiation to restrict the length of nonmetallic conduit when installed in compliance with the National Electrical Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3778)

18- 105 - (600-41(g)): Reject
SUBMITTER: Albert Sklar, Neon By Sklar, Inc.
RECOMMENDATION: Revise as follows:
Electrode enclosures such as receptacles, boots, caps or cups shall be capable of withstanding both normal and abnormal conditions, including the neon electrode end of life. And shall be spaced at least 1-1/2" (38 mm) from grounded or bonded parts or shall be separated from grounded or bonded parts by noncombustible material, or shall be made of noncombustible material and be listed for the purpose.
SUBSTANTIATION: A- Neon fires are still a negative factor in the neon sign and lighting industry. This is in spite of the efforts of transformer manufacturers and the Code Panel to include the use of secondary ground fault protection into the manufacturing process of neon signs. The SGFI (secondary ground fault interrupter) does not disable the transformer's secondaries unless there is a fault to ground. Fires can still happen in situations where the arc of the secondary does not go to ground.
B- Section 600-32(a) rightfully states that, "nonmetallic conduit or flexible nonmetallic conduit when operated at 100 Hz or less shall be spaced at least 1-1/2" (38 mm) from grounded or bonded parts."
Summary: Nonmetallic conduit containing a GTO wire conductor with substantial insulation, as well as the nonmetallic conduit, is considerably thicker than boots, caps and sleeving, and is constructed with a very similar material. However, the high voltage connection, which is merely protected from ground by the use of a polymeric boot or cap, and which may possess the very highest potential that a neon transformer produces, has no clearance requirement in the listing or recognition by UL or other testing laboratories for this protection.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel assumes the proposal was referring to 600-42(g). End of life requirements and tests may be appropriate for product standards, not for installation codes.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 11

(Log #3743)

18- 106 - (600-42): Reject
SUBMITTER: Donald W. Shields, Town of Normal, IL
RECOMMENDATION: Add new text to read as follows:
Electrode Spacing: Electrodes not connected in listed receptacles shall be spaced 25 mm (1 inch) from their outer shell edge to any surface.
SUBSTANTIATION: Clearance spacing requirements for electrodes is required when listed receptacles are not used. Proximity to any surface, especially when conditions are wet, changes the capacitance in the system. Close proximity to a surface, especially a grounded one, in border applications can lead to burn through of the shell wall, pin holes, and potential arcing conditions.
Air gap is still the best and safest form of insulation. The addition of this spacing requirement will follow the UL 48 guidelines for minimum high-voltage spacing requirements. This will also align itself with the guidelines of 600-32(e) spacing for GTO. The requirement dimension will facilitate accurate installations and proper inspections. It should make field installed skeleton neon easier for the required sign off procedures by municipalities.
PANEL ACTION: Reject.
PANEL STATEMENT: No technical substantiation was submitted to restrict other listed enclosure types. There are listed enclosures other than receptacles that have no spacing requirements as a condition of their listing.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 11
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
COCHRAN: While it is true that some electrode enclosures are listed at zero clearance, not all listed products are! The UL 48 Standard has a set of clearance dimensions based on operational voltages of neon supplies. The required clearance distance for 10,001 - 15,000 volt insulated conductors and ground (mounting surfaces, etc.) is defined by Table 29.2 of the UL 48 Standard. The defined clearance dimension will ensure safe installations regardless of enclosure, transformer current rating or voltage.

Note: The sequence no. 18-17 was not used.

(Log #2270)

19- 149 - (604-6): Accept
SUBMITTER: Robert A. McCullough, Ocean County Construction Insp. Dept., NJ
RECOMMENDATION: Revise text as follows:
604-6. Construction.
(a) ~~Cable or Conduit~~ Types.
(1) Cables. Cable shall be listed armored cable or metal-clad cable containing nominal 600-volt No. 10 or 12 copper-insulated conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.
(2) Conduits. Conduit shall be listed flexible metal conduit or listed liquidtight flexible conduit containing nominal 600-volt No. 10 or 12 copper-insulated conductors with a bare or insulated copper equipment grounding conductor equivalent in size to the ungrounded conductor.

Exception No. 1 to (1) and (2): A fixture tap, maximum 6 ft (1.83 m) long, intended for connection to a single fixture shall be permitted to contain conductors smaller than No. 12 but not smaller than No. 18.

Exception No. 2 to (1) and (2): Conductors smaller than No. 12 shall be permitted for remote-control, signaling, or communications circuits. The assembly shall be listed for the purpose.

(3) Flexible Cord. ~~Exception No. 3 to (1) and (2):~~ Flexible cord suitable for hard usage, with minimum No. 12 conductors, shall be permitted as part of a listed factory-made assembly not exceeding 6 ft (1.83 m) in length when making a transition between components of a manufactured wiring system and utilization equipment, not permanently secured to the building structure. The cord shall be visible for its entire length and shall not be subject to strain or physical damage.

~~(3)~~ (b) Marking. Each section shall be marked to identify the type of cable, flexible cord, or conduit.

~~(b)~~ (c) Receptacles and Connectors. Receptacles and connectors shall be of the locking type, uniquely polarized and identified for the purpose, and shall be part of a listed assembly for the appropriate system.

~~(c)~~ (d) Other Component Parts. Other component parts shall be listed for the appropriate system.

SUBSTANTIATION: Titles added to (1) and (2) to conform to new Style Manual. Former Exception No. 3 is restated as new (3) since it is a permitted wiring method. Existing (3) is retitled (b) ,Marking, as the requirements apply to the three types of construction used in MWS. Remaining sections relettered accordingly.

PANEL ACTION: Accept.

19- 150 - (604-6, Exceptions No. 4 through No. 9): Accept in Principle in Part

Note: The Technical Correlating Committee notes that the word "clause" will be deleted. The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual 3.1.4 relative to the excessive use of Exceptions. The Technical Correlating Committee directs that the Panel clarify the Panel Action on this Proposal regarding the cables added in the Exception to 604-6(a)(1) and (2). This action will be considered by the Panel as a Public Comment.

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Add new Exceptions to read as follows:

Exception No. 4 to (1) and (2): Cables listed in clause 725-61 shall be permitted for wiring of devices and appliances identified in Article 725.

Exception No. 5 to (1) and (2): Cables listed in clauses 760-31 and 760-61 shall be permitted for wiring of fire alarm equipment identified in Article 760.

Exception No. 6 to (1) and (2): Cables listed in clause 770-50 shall be permitted for connection to devices and appliances utilizing optical fiber technology.

Exception No. 7 to (1) and (2): Cables listed in clause 800-50 shall be permitted for wiring of equipment identified in clause 800-1.

Exception No. 8 to (1) and (2): Cables listed in clause 820-50 shall be permitted for wiring of equipment identified in clause 820-1.

Exception No. 9 to (1) and (2): Cables listed in clause 830-5 shall be permitted for wiring of equipment identified in clause 830-1.

SUBSTANTIATION: There are available a variety of Manufactured Wiring Systems that are not typically wired as indicated by this section. Examples may include telecommunications systems such as loud speaker assemblies, CCTV cameras, aural and visual annunciators, motion detectors, light sensors, audio sensors.

PANEL ACTION: Accept in Principle in Part.

Revise recommendation as follows and renumber as appropriate:

"Exception No. 4 to (1) and (2): Cables listed in 725-61 shall be permitted for wiring of devices and appliances identified in Article 725.

Exception No. 7 to (1) and (2): Cables listed in 800-50 shall be permitted for wiring of equipment identified in clause 800-1.

Exception No. 8 to (1) and (2): Cables listed in 820-50 shall be permitted for wiring of equipment identified in clause 820-1.

Exception No. 9 to (1) and (2): Cables listed in 830-5 shall be permitted for wiring of equipment identified in clause 830-1."

PANEL STATEMENT: Exceptions No. 5 and No. 6 are outside of the scope of the article. The term clause is not used in the Code.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 8

VOTE ON PANEL ACTION:

AFFIRMATIVE: 8

(Log #1094)

19- 151 - (604-6(a)): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Revise Article 604-6(a) as follows:

604-6(a)(1) - change "No. 10 or 12" to "10 or 12 AWG"

604-6(a)(2) - change "No. 10 or 12" to "10 or 12 AWG"

604-6(a)(2), Exception No. 1 - change "No. 12" to "12 AWG" and "No. 18" to "18 AWG"

604-6(a)(2), Exception No. 2 - change "No. 12" to "12 AWG"

604-6(a)(2), Exception No. 3 - change "No. 12" to "12 AWG".

SUBSTANTIATION: To provide consistency throughout the Code The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

PANEL STATEMENT: The NEC Style of Manual does not specify the language used one way or another. The NFPA Manual of Style seems to prefer 10AWG. Product standards use 10 AWG or 10 AWG 110-6 says that the conductor sizes are expressed in AWG or in circular mils so the AWG is implied The panel recognizes that the TCC may desire to take a different action to be consistent with the Code.

SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 610-2(b)(2), replace "6 in. (152 mm)" with "150 mm (6 in.)".
2. In Section 610-21(b), replace "1 1/2 in. (38 mm)" with "38 mm (1 1/2 in.)".
3. In Section 610-21(c), replace "20 ft. (6.1 m)" with "6.0 m (20 ft.)".
4. In Section 610-21(c), replace "6 in. (152 mm)" with "150 mm (6 in.)".
5. In Section 610-21(c), replace "3 in. (76 mm)" with "75 mm (3 in.)".
6. In Section 610-21(c), replace "40 ft. (12.2 m)" with "12 m (40 ft.)".
7. In Section 610-21(d), replace "2 1/2 in. (64 mm)" with "65 mm (2 1/2 in.)".
8. In Section 610-21(d), replace "80 ft. (24.4 m)" with "25 m (80 ft.)".
9. In Section 610-21(d), replace "50 ft (15.2 m)" with "15 m (50 ft.)".
10. In Section 610-21(e), replace "15 ft. (4.57 m)" with "4.5 m (15 ft.)".
11. In Section 610-21(e), replace "1 in. (25.4 mm)" with "25 mm (1 in.)".
12. In Section 610-57, replace "2 1/2 ft. (762 mm)" with "750 mm (2 1/2 ft.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 2 Kelly, Laney

(Log #974)

12- 15 - (610-11): Reject
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 7 to correlate with the action in Article 333. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Wiring Method. Conductors shall be enclosed in raceways or be ~~Type AC cable with insulated grounding conductor.~~ Type MC or Type MI cable unless otherwise permitted <u>or required</u> in (a) through (e).
(a) No change.

(b) No change.
(c) Where flexible connections are necessary to motors and similar equipment, flexible stranded conductors shall be installed in flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, ~~multiconductor~~ Type AC cable with insulated equipment grounding conductor, or an approved nonmetallic enclosure.
SUBSTANTIATION: Editorial. The first paragraph indicates general wiring methods include Type AC cable. However, Section 333-4(5) limits Type AC except as provided in Section 610-11(c), wherein it is only covered by the term "multiconductor cable". Code users can easily overlook the restrictions of Section 333-4(5) when applying this section, which is misleading. The proposal would correlate the two sections.
Subsections (c) and (d) are not permissive but mandatory and warrant "or required" in the first paragraph.
PANEL ACTION: Reject.
PANEL STATEMENT: In the 1996 NEC cycle, the panel voted to allow Type AC cable with insulated grounding conductor to be used as a wiring method for cranes and hoists. The problem described by the submitter is that Article 333 was not changed to correlate with this action. This problem needs to be rectified by changing 333-4(5). The Panel requests the TCC to address the issue with Panel 7.

(Log #2087)

12- 16 - (610-11(c)): Accept in Principle
SUBMITTER: Joel A. Rencsok, Scottsdale, AZ
RECOMMENDATION: Delete the following ~~(or an approved nonmetallic enclosure.)~~ in the last sentence.
c. Where flexible connections are necessary to motors and similar equipment, flexible stranded conductors shall be installed in flexible metal conduit, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, multiconductor cable~~, or an approved nonmetallic enclosure~~.
SUBSTANTIATION: An approved nonmetallic enclosure does not by itself imply that this approved enclosure is flexible.
During the rewrite this may have been overlooked.
This leaves the authority having jurisdiction wondering if flexibility is really required.
PANEL ACTION: Accept in Principle.
Rather than deleting the language as proposed, insert the word "flexible" between "approved" and "nonmetallic".
PANEL STATEMENT: The panel action clarifies the provision and should meet the submitter's intent.

NOT RETURNED: 2 Kelly, Laney

(Log #975)

12- 17 - (610-12(b)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
(b) Bushing in Lieu of a Box. A bushing shall be permitted to be used in lieu of a box or terminal fitting specified in (a) at the end of a ~~rigid metal conduit, intermediate metal~~ conduit or electrical metallic tubing where the raceway terminates at enclosed controls or similar equipment, including contact conductors, collectors, resistors, brakes ~~power circuit~~ limit switches, and dc split frame motors.
SUBSTANTIATION: Editorial. The specific type terminal fitting of (a) should be noted. Since the "raceways" of Section 610-11 include NMRC and flexible conduits, a bushing should be permitted for those raceways. Since flexible conduit must be supported within 12 in. of termination, generally, this should not allow for excessive movement. Limit switches in control circuits should be included.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not document any problems with the current language.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 2 Kelly, Laney

(Log #2231)

12- 18 - (610-13(a)): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Revise to read:
A conductor(s) exposed to external heat or connected to resistors shall have a ~~flame-resistant~~ flame tested outer covering or be covered with ~~flame-resistant~~ a listed tape individually or as a group.
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
A "listed" tape for the purpose could be evaluated for not only its capability to meet an applicable flame test requirement but other physical and electrical properties that may be necessary for this application.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "flame tested" does not specify any level of performance, whereas the term "flame resistant", as currently used, implies some level of performance with regard to fire behavior. The submitter offers no substantiation any problems exist with the current language.

12- 21a - (610-31): Accept
SUBMITTER: CMP 12
RECOMMENDATION: In list Item (2), delete "Arranged to be locked in the open position" and replace with "Capable of being locked in the open position"
SUBSTANTIATION: The proposal is necessary for consistency with 430-102 and 610-32.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 16
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 2 Kelly, Laney

(Log #976)

12- 22 - (610-32): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Disconnecting Means for Cranes and Hoists. A motor-circuit switch, molded-case switch, or circuit breaker ~~arranged to be locked in the open position~~ with provisions for locking in the open position shall be provided in the leads from the runway contact conductors or other power supply on all cranes and monorail hoists. ~~a motor circuit switch, circuit breaker, or molded case switch arranged to be locked in the open position shall be provided.~~
(remainder unchanged)
SUBSTANTIATION: Editorial. Proposal incorporates the second sentence which is redundant except for addition of molded case switch. "Arranged to be locked" infers the disconnecting means must be locked open, as "arranged" in other sections infers a mandatory condition, e.g., Section 380-8(b).
PANEL ACTION: Accept in Principle.
Revise to read as follows:
"Disconnecting Means for Cranes and Monorail Hoists. A motor-circuit switch, molded-case switch, or circuit breaker ~~arranged to be locked in the open position~~ shall be provided in the leads from the runway contact conductors or other power supply on all cranes and monorail hoists. ~~a motor circuit switch, circuit breaker, or molded case switch arranged to be locked in the open position shall be provided. The disconnecting means shall be capable of being locked in the open position."~~
(remainder unchanged)
PANEL STATEMENT: The proposal has been revised to be consistent with other references in the Code. The revisions should be consistent with the submitter's intent.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NOT RETURNED: 2 Kelly, Laney

(Log #4251)

12- 23 - (610-42): Accept in Principle in Part
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Revise as follows:
Branch-Circuit Short-Circuit and Ground-Fault Protection. Branch circuits shall be protected ~~as follows~~ in accordance with (a) following. Branch-circuit taps, where made, shall comply with (b).
(a) Fuse or Circuit Breaker Rating. Crane, hoist, and monorail hoist motor branch circuits shall be protected by fuses or inverse-time circuit breakers that have a rating in accordance with Table 430-152. Where two or more motors operate a single motion, the sum of their nameplate current ratings shall be considered as a single motor current in ~~the above~~ this calculation.
(b) Taps.
(1) Multiple Motors. Where two or more motors ~~shall be permitted to be~~ are connected to the same branch circuit, ~~if~~ each ~~no~~ tap conductor to an individual motor ~~has~~ shall have an ampacity not less than one-third that of the branch circuit. ~~and if~~ Each motor shall be protected from overload according to Section 610-43.
(2) Control Circuits. Where taps to control circuits ~~shall be permitted to be taken from~~ originate on the load side of a branch-circuit protective device, ~~provided~~ each tap and piece of equipment ~~is~~ shall be ~~properly~~ protected in accordance with Section 430-72.

~~Where two or more motors operate a single motion, the sum of their nameplate current ratings shall be considered as a single motor current in the above calculations.~~

~~Two or more motors shall be permitted to be connected to the same branch circuit if no tap conductor to an individual motor has an ampacity less than one third of the branch circuit and if each motor is protected from overload according to Section 610-43.~~

~~(b) Taps to Brake Coils.~~ Exception: Taps to brake coils ~~do not require~~ shall be permitted without separate overcurrent protection.

SUBSTANTIATION: This section was my poster child in the prior cycle of how not to convert exceptions to positive text. There were two exceptions and they changed their typeface and nothing else. The result was two exceptions in all but name, unnumbered, difficult for an authority having jurisdiction to easily cite and therefore amenable to confusion. As a matter of principle, I don't offer criticism without offering solutions, and this proposal is an attempt to look at the entire section editorially, to see if the exceptions should go back or whether there's another way.

In this case, the opening section language needs to editorially set up the fact that what will come after may not be consistent except by applying the opening language. Former Exception No. 1 describes how to apply the general rule in a common and specific application. As such, it should be directly integrated with the main rule for branch-circuit protection. As presented in this proposal, the result is a two-sentence rule. The sentences aren't overly long, and they flow together well.

The next subsection picks up, in two numbered paragraphs and an exception, the three instances of tap applications in the original rule (one of which occurred within the principal rule). The tap rules have been reworded to avoid the exception form ("shall be permitted"). The first one also now uses two sentences in order to break up a long sentence addressing two distinct subjects (minimum ampacity and overload protection). The second paragraph required some research to determine the subject of the imprecise word "properly," which under current style manual provisions is suspect. This was Proposal 12-36 for the 1975 NEC, and after looking at the entire context, it seems the intent was to describe circuit parameters rather than physical protection. The proposal wording is specific for that reason. If CMP 12 wants to be somewhat less precise, it could add Section 430-73 to the reference, or it could even reference all of Part F of Article 430.

Again referencing the substantiation for 1975 NEC Proposal 12-36, the last part of the rule allows for brake circuits to run to failure, but without being a requirement that they do so. As such it is permissive design allowance in the control circuit design. Since the control circuit rule now appears as (b)(2), this is now a properly worded permissive exception at this point.

It is possible to convert many exceptions into positive text, as this proposal demonstrates. However, it requires enormous care, editorial rigor, and often extensive research. Furthermore, there is a definite role for a limited application of the exception form, as the TCC has made very clear. For clarity, what follows is the text of this section if the proposal is accepted:

610-42. Branch-Circuit Short-Circuit and Ground-Fault Protection. Branch circuits shall be protected in accordance with (a) following. Branch-circuit taps, where made, shall comply with (b).

(a) Fuse or Circuit Breaker Rating. Crane, hoist, and monorail hoist motor branch circuits shall be protected by fuses or inverse-time circuit breakers that have a rating in accordance with Table 430-152. Where two or more motors operate a single motion, the sum of their nameplate current ratings shall be considered as a single motor current in this calculation.

(b) Taps.

(1) Multiple Motors. Where two or more motors are connected to the same branch circuit, each tap conductor to an individual motor shall have an ampacity not less than one-third that of the branch circuit. Each motor shall be protected from overload according to Section 610-43.

(2) Control Circuits. Where taps to control circuits originate on the load side of a branch-circuit protective device, each tap and piece of equipment shall be protected in accordance with Section 430-72.

Exception: Taps to brake coils shall be permitted without separate overcurrent protection.

PANEL ACTION: Accept in Principle in Part.

Revise as follows:

"610-42. Branch-Circuit Short-Circuit and Ground-Fault Protection. Branch circuits shall be protected in accordance with (a). Branch-circuit taps, where made, shall comply with (b).

(a) Fuse or Circuit Breaker Rating. Crane, hoist, and monorail hoist motor branch circuits shall be protected by fuses or inverse-time circuit breakers that have a rating in accordance with Table 430-152. Where two or more motors operate a single motion, the sum of their nameplate current ratings shall be considered as that of a single motor.

(b) Taps.

(1) Multiple Motors. Where two or more motors are connected to the same branch circuit, each tap conductor to an individual motor shall have an ampacity not less than one-third that of the branch circuit. Each motor shall be protected from overload according to Section 610-43.

(2) Control Circuits. Where taps to control circuits originate on the load side of a branch-circuit protective device, each tap and piece of equipment shall be protected in accordance with Section 430-72.

(3) Brake Coils. Taps without separate overcurrent protection shall be permitted to brake coils."

The panel did not accept the creation of a new exception. The proposed wording is relocated to item (3).

PANEL STATEMENT: The editorial changes, as revised by the panel, will meet the submitter's intent and help prevent any misapplication of this section.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #3277)

12- 25 - (620-3(a)): Reject
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise 620-3(a) with the additions (underlined) and deletions (strike through) as shown. The entire text is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

(a) Power Circuits. Branch circuits to door operator controllers and door motors and branch circuits and feeders to motor controllers, driving machine motors, machine brakes, and motor-generator sets shall not have a circuit voltage in excess of 600 volts. Internal voltages of power conversion and functionally associated equipment, including the interconnecting wiring, shall be permitted to have higher voltages provided that all such equipment and wiring shall be listed for the higher voltages. Where the voltage exceeds 600 volts, warning labels or signs ~~that read~~ with the following words or equivalent: "DANGER - HIGH VOLTAGE" shall be attached to the equipment and shall be plainly visible.

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.
PANEL ACTION: Reject.
PANEL STATEMENT: The term "equivalent" is vague and unenforceable in accordance with the NEC Style Manual.

(Log #1895)

12- 26 - (620-5(a)): Accept
SUBMITTER: Charles M. Trout, Maron Electric Co. Inc.
RECOMMENDATION: Delete the word "is" after (4) and replace with "shall be permitted to be". The paragraph shall now read:

(a) Flexible Connections to Equipment. Electrical equipment in (1) through (4) shall be permitted to be provided with flexible leads to all external connections so that it can be repositioned to meet the clear working space requirements of Section 110-26(a).

SUBSTANTIATION: The present language is in an informational form which is suitable for fine print notes. This paragraph contains mandatory requirements and must be written in mandatory language.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #1712)

12- 27 - (620-5(e) (New)): Reject
SUBMITTER: Nick Marchitto, Otis Elevator Co./Rep. Nat'l Elevator Industry Inc. (NEII)
RECOMMENDATION: Add the following text:

(e) Depth of Working Space. Condition 2 working clearances in Section 110-26(a)(1) shall be permitted between controllers, disconnecting means, and other electrical equipment located across from each other where conditions of maintenance and supervision ensure that written procedures have been adopted to prohibit equipment located across from each other from being open at the same time, and only qualified persons who are authorized will service the equipment.

SUBSTANTIATION: To permit relief in tight machine room locations (e.g., hydraulic elevator machine rooms) where there are written procedures prohibiting facing equipment from being open at the same time and where only authorized and qualified personnel will service the equipment.
PANEL ACTION: Reject.
PANEL STATEMENT: Minimum dimensional requirements are provided in 110-26 to assure safety which should not be compromised.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Kelly, Laney
EXPLANATION OF NEGATIVE:
DROSTE: Elevator equipment is only serviced by authorized and qualified persons who work under the strick requirements outlined in Section 110-26(a)(1), Exception No. 3. If the present clearance requirements in the code are safe for existing buildings, the same clearances are safe for new buildings also.

COMMENT ON AFFIRMATIVE:
JONES: The requirements of 110-26 are intended to protect qualified persons. Spaces for electrical equipment need to be designed with adequate working space to provide safe working conditions for qualified persons and their apprentices. A written procedure is not an effective means of safeguarding a person from the hazards of electricity.
QUAVE: Section 110-26 provides for minimum dimensional requirements to assure the safety of qualified persons. To alter these spaces or to rely on written procedures could create more hazards.

(Log #2232)

12- 28 - (620-11): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" (or "flame retardant") to "flame tested" in four (4) places: one (1) in 620-11 FPN, one (1) in 620-11(a), two (2) in 620-11(c).
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
PANEL ACTION: Reject.
PANEL STATEMENT: The term "flame tested" does not specify any level of performance, whereas the term "flame retardant", as currently used, implies some level of performance with regard to fire behavior. The submitter offers no substantiation that any problems exist with the current language.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #2830)

12- 29 - (620-11(d)): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 6 for information.
SUBMITTER: Ravindra H. Ganatra, Alcan Cable /Rep. CANENA Tech Harmonization Subcomm. For Bldg Wire and Cable Products
RECOMMENDATION: Revise 620-11(d) as follows:
Insulation. All conductors shall have an insulation voltage rating equal to at least the maximum nominal circuit voltage applied to any conductor within the enclosure, cable, or raceway. Insulations and outer coverings that are marked for limited smoke ~~designated with the suffix "LS"~~ and are so listed shall be permitted.
SUBSTANTIATION: This proposal is submitted on behalf of the THSC - Building Wire and Cable Product Standards, of Council of Harmonization of Electrotechnical Standardization of North America (CANENA).
Abbreviation LS has been found to represent different requirements in different national product standards in North America. In Mexico, "LS" is used to indicate compliance with requirements associated with marking for low smoke. In the US, "LS" marking has been used to indicate compliance with requirements associated with marking for limited smoke. However, the requirements in Mexico and the US are different. Further, requirements for "ST1" marking used in Canada are similar to limited smoke marking used in the US.
Thus, removal of the abbreviation in the Code will facilitate harmonization of marking requirements in the product standards.
The proposal does not recommend any change in the test method or performance requirements for a product being evaluated for limited smoke marking.
PANEL ACTION: Accept.

NOT RETURNED: 2 Kelly, Laney

(Log #1098)

12- 30 - (620-12): Accept
SUBMITTER: James M. Daly, BICC General
RECOMMENDATION: 620-12(a)(1) - change "No. 14" to "14 AWG" in two places and "No. 20" to "20 AWG"
620-12(a)(2) - change "No. 20" to "20 AWG"
620-12(b) - change "No. 24" to "24 AWG".
SUBSTANTIATION: To provide consistency throughout the Code The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.

(Log #1713)

12- 31 - (620-21): Reject
SUBMITTER: Nick Marchitto, Otis Elevator Co./Rep. Nat'l Elevator Industry Inc. (NEII)
RECOMMENDATION: Revise text as follows:
620-21. Wiring Methods. Conductors and optical fibers located in hoistways, in escalator and moving walk wellways, in wheelchair lifts, stairway chair lift runways, ~~and~~ machinery spaces, control spaces, in or on cars, ~~and~~ in machine rooms, and control rooms, not including the traveling cables connecting the car or counterweight and hoistway wiring, shall be installed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, rigid nonmetallic conduit, or wireways, or shall be type MC, MI, or AC cable unless otherwise permitted in (a) through (c).
SUBSTANTIATION: To harmonize with terms used within the A17.1 Elevator Safety Code.
PANEL ACTION: Reject.
PANEL STATEMENT: The substantiation does not provide information as to the definition of new terminology. The panel feels that spaces will be permitted that would not be protected by the other provisions of Article 620.
The submitter has not presented any technical substantiation for this change. The change is too broad in scope.
The panel is of the opinion that new spaces will be created by this proposal that are not adequately defined and this may lead to other problems relative to the application of Article 620 and other requirements of this Code.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Kelly, Laney
EXPLANATION OF NEGATIVE:
DROSTE: The terminology used in Article 620 should reflect the terminology used in ASME A17.1, the American National Standard for Elevators and Escalators.

(Log #2233)

12- 32 - (620-21): Reject
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" (or "flame retardant") to "flame tested" in seven (7) places: 620-21(a)(1)(b), 620-21(a)(2)(c), 620-21(a)(2)(d), 620-21(a)(3)(c), 620-21(a)(4), 620-21(b)(2), and 620-21(c)(2).
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be

tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

PANEL ACTION: Reject.

PANEL STATEMENT: The term "flame tested" does not specify any level of performance, whereas the term "flame retardant", as currently used, implies some level of performance with regard to fire behavior. The submitter offers no substantiation any problems exist with the current language.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Kelly, Laney

(Log #3027)

12- 33 - (620-21): Reject

SUBMITTER: Gerard Henry, Plano, TX

RECOMMENDATION: Revise text as follows:

620-21. Wiring Methods. Conductors located in hoistways, in escalator and moving walk wellways, in wheelchair lifts, stairway chair lift runways, and machinery spaces, in or on cars, from machine rooms/hoistways to remote Fire Command Panels, and in the machine and control rooms not including the traveling cables connecting the car and hoistway wiring, shall be installed in rigid metal conduit, intermediate metal conduit, electrical metallic tubing, rigid nonmetallic conduit, or wireways, or shall be Type MC, MI, or AC cable.

SUBSTANTIATION: A review of Article 620 of the National Electrical Code (NEC) revealed that only wires run in both elevator hoistways and machine rooms are required to be run in conduit. The Code is silent on elevator wiring run from machine rooms/hoistways to remote Fire Command Centers. The elevator panels in these Fire Command Centers typically provide "Phase I Fire Recall Switches" in addition to "Emergency Power Selector Switches." In many cases electrical contractors are directing the elevator contractors to simply run this critical wiring to these remote panels in open rib retention wire trays which run around the perimeter of a building. This wiring method in lieu of the traditional use of conduits thereby directly exposes this critical elevator wiring to open flames in a fire resulting in grounding and or shorting conditions. This grounding and shorting condition may disable the elevators during a fire emergency when they are needed by fire fighting personnel.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal is adequately addressed by 760-1, FPN-1.

(Log #4395)

12- 34 - (620-21(a)(1), Exception (New)): Reject

SUBMITTER: Monte R. Ewing, State of Wisconsin

RECOMMENDATION: Add an exception to read as follows:

Exception: The hoistway storm water sump and the hoistway oil recovery pump shall be permitted to be cord connected. The cord shall be a hard usage oil resistant type and shall be routed where not subject to physical damage.

SUBSTANTIATION: The present text does not permit cord-connected appliances such as these within a hoistway. The single receptacle permitted by Section 620-85 is pointless when a sump pump is not permitted to have a cord per the present Section 620-21(a)(1). The State of Wisconsin has created this modification in their 1999 code and I feel that it should be addressed by the National Electrical Code.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided substantiation documenting problems with the current wording. Cord-connected appliances are not prohibited in the pit by the current language.

(Log #4394)

12- 49 - (620-51(a), Exception (New)): Reject

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the panel as a public comment.

SUBMITTER: Monte R. Ewing, State of Wisconsin

RECOMMENDATION: Add an exception to read as follows:

Exception: Where an individual branch circuit supplies a wheelchair lift, the disconnecting means required by 620-51(c)(4) shall be permitted to comply with Section 430-109, Exception No. 3. This disconnecting means shall be listed and shall be capable of being locked in the open position.

SUBSTANTIATION: Most wheel chair lifts are wired from an individual branch circuit and are not of grouped installations as are elevators. They pose no threat if the overcurrent device is not selectively coordinated, as does an elevator. The biggest problem is there are contained units in a since. The controller is built into the lift and they both fit into the lift/hoistway area. There is no location within this lift area to locate a disconnect that may require servicing while energized such as a fused disconnect or a circuit breaker. By permitting compliance with Section 109 there is an option to install a toggle switch as the disconnecting means and the need for servicing while energized problem goes away. This text has been incorporated into the Wisconsin State Electrical Code to resolve this ongoing problem and I feel that the provision belongs in the National Electrical Code.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no Exception 3 to 430-109 in the 1999 NEC.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 9
NEGATIVE: 3
NOT RETURNED: 2 Kelly, Laney

EXPLANATION OF NEGATIVE:

CARTAL: This proposal should have been accepted as the submitter addressed a valid concern dealing with wheelchair lifts. The panel statement was only concerned with the fact that the referenced NEC Exception is no longer in the 1999 NEC which does not deal with the submitter's concerns.

QUAVE: Although there is no Exception No. 3 to Section 430-109 in the 1999 NEC, the reference makes sense when using the 1996 NEC. Section 430-109, Exception No. 3 from the 1996 NEC was removed as an Exception and put in positive language for the 1999 NEC and renumbered as 430-109(3). The requirement to allow a general use switch capable of being locked in the open position near the controller is a safe installation.

The Article 100 definition of "In Sight From" would allow a visible switch located 50 ft away. This I believe may cause a safety concern for servicing the unit.

The submitter's incorrect NEC reference should not keep this panel from accepting Proposal 12-49.

TROUT: This proposal should have been accepted. The panel statement does not indicate a serious review of the submitter's concerns. The submitter erred in using a 1996 NEC code reference in his substantiation, but the language in the section referred to by the submitter is present in the referred to section in the 1999 NEC, but has been removed as an exception and put into the body of Section 430-109(c) in positive language.

The proposal has merit and would eliminate a dangerous condition that now exists while servicing this equipment.

(Log #1727)

12- 50 - (620-51(b)): Reject

SUBMITTER: Nick Marchitto, Otis Elevator Co./Rep. Nat'l Elevator Industry Inc. (NEII)

RECOMMENDATION: Revise text as follows:

(b) Operation. No provision shall be made to open or close this disconnecting means from any other part of the premises. If sprinklers are installed in hoistways, machine <u>rooms, control</u> rooms, ~~or~~ machinery <u>spaces, or control</u> spaces, the disconnecting means shall be permitted to automatically open the power supply to the affected elevator(s) prior to the application of water. No provision shall be made to automatically close this disconnecting means. Power shall only be restored by manual means.

FPN: For additional...

SUBSTANTIATION: To harmonize with the terms used in the A17.1 Elevator Safety Code.

PANEL ACTION: Reject.

PANEL STATEMENT: See the panel action on Proposal 12-31.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Kelly, Laney

EXPLANATION OF NEGATIVE:

DROSTE: The terminology used in Article 620 should reflect the terminology used in ASME A17.1, the American National Standard for Elevators and Escalators.

(Log #977)

12- 51 - (620-51(c)): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

(c) Location. The disconnecting means shall be located where it is ~~readily~~ accessible <u>only</u> to qualified persons.

SUBSTANTIATION: Editorial. Disconnecting means are generally required to be readily accessible by Section 380-8 and other sections without reference to qualified persons. "Accessible" appears to be the correct term and is used in sections which do refer to qualified persons, and the definition reference to locked doors, etc. supports that view. Additionally, the literal wording does not disallow unqualified persons.

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal changes the meaning of the provision, it is not merely editorial. The substantiation does not provide any definitive technical reasons for the change. The submitter has not provided adequate substantiation to document problems with the existing language.

12- 53 - (620-51(c)(2)): Accept

SUBMITTER: Nick Marchitto, Otis Elevator Co./Rep. Nat'l Elevator Industry Inc. (NEII)

RECOMMENDATION: Revise second paragraph as follows:

Where the driving machine or the motor-generator set is located in a remote <u>machine room or remote</u> machinery space, a single means for disconnecting all ungrounded main power supply conductors shall be provided and be capable of being locked in the open position.

SUBSTANTIATION: To harmonize with the terms used in the A17.1 Elevator Safety Code.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #3278)

12- 54 - (620-52(b)): Reject
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise 620-52(b) with the additions (underlined) and deletions (strike through) as shown. The entire text is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.

(b) Warning Sign for Multiple Disconnecting Means. Where multiple disconnecting means are used and parts of the controllers remain energized from a source other than the one disconnected, a warning sign shall be mounted on or next to the disconnecting means. The sign shall be clearly legible ~~and shall read~~ with the following words or equivalent:

WARNING - PARTS OF THE CONTROLLER ARE NOT DE-ENERGIZED BY THIS SWITCH

SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.

The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.
PANEL ACTION: Reject.
PANEL STATEMENT: See the panel action on Proposal 12-25.

(Log #3154)

12- 58 - (620-62): Reject
SUBMITTER: George D. Gregory, Square D Company
RECOMMENDATION: Add new text to read as follows:
Where ground-fault protection is provided on the supply side of the individual driving machine disconnecting means, an additional step of ground-fault protection shall be installed at the driving machine disconnecting means and shall be selectively coordinated with the supply side protection.
SUBSTANTIATION: Selective coordination must include ground-fault protection as well as overcurrent protection. Supply-side ground-fault protection may be installed in accordance with Section 230-95 or 215-10 or for other reasons unique to the installation. Ground-fault conditions are at least as likely to occur as any form of overcurrent.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has offered no technical substantiation for the addition of ground fault protection of equipment (GFPE) at each driving machine disconnect. The requirements for GFPE on the line side is to prevent equipment failures on large services and feeders. There is no rationale to extend this requirement to branch circuits. Selectivity can be provided without GFPE requirements.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #3443)

12- 59 - (620-62): Reject
SUBMITTER: Stan Price, Electric League of the Pacific Northwest
RECOMMENDATION: Revise text to read as follows:
620-62 Selective Coordination: When more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each disconnecting means shall be selectively coordinated [revised text follows] outside the instantaneous range of one cycle (0.0167 seconds) [revised text ends] with any other supply side overcurrent protective devices.
SUBSTANTIATION: Elevators - Selectivity of Overcurrent Protective Devices.
A Summary of a survey of the National Electrical Code, supporting documents and related comments with regard to requirements for overcurrent protection for elevators follows:
1. The Current Code: The 1999 NEC 620-62, Selective Coordination, states " Where more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each disconnecting means shall be selectively coordinated with the other supply side overcurrent protective devices."
2. The NEC Handbook Comments - Logic for Selectivity: The 1996 NEC Handbook provides the following logic for this code article, "Coordination of the overcurrent protective devices is important. For example, if a building contains three elevators and a fault occurs in one, only the overcurrent device ahead of the faulted elevator should open. This leaves the remaining two elevators in operation."
If the overcurrent devices in the elevator room do not have proper coordination with the feeder overcurrent device, all three elevators might be disconnected from the power source.
To selectively coordinate overcurrent protective devices, manufacturer's time-current curves, let-through and withstand capacity data, and the unlatching times data must be used when sizing or setting overcurrent devices."
3. Typical Modes of Motor Failure: The normal mode of failure for a motor is through an arcing fault. These types of faults typically have a relatively high impedance and, therefore, a fault current level far less than that associated with a bolted line-to-ground or line-to-line fault.
4. Designing and Inspecting in Compliance with this Code Article:
a. An example of a multi-machine elevator installation that may typically be encountered in the design of the electrical distribution system for a commercial office building includes a electrical main switchboard with a 4000A/3P main circuit breaker, a 600A/3P feeder breaker to a rooftop elevator panel and a 600A elevator panel equipped with four 150A/3P breakers each serving a 25 hp elevator motor.
b. The problem that we are facing is that these three breakers, the 4000A/3P Main Breaker, the 600A/3P elevator panel feeder breaker in the main switchboard and the 150A/3P breaker in the 600A rooftop elevator distribution panel will not coordinate in the instantaneous range should a bolted fault occur.
c. Based on the present wording of 620-62, the inspection community has concluded that selectivity does not exist across the entire range of possible fault current values, namely for bolted faults in the instantaneous range and, therefore, the circuit breaker designs typically will not comply with this code article.
d. Early versions of this code article made reference to both circuit breakers and fuses as overcurrent protective devices which seems to imply that circuit breakers with their potential lack of selectivity in the instantaneous range were considered to be acceptable for compliance.
e. One of the most logical steps that may be taken to comply with this code article is to minimize the number of overcurrent protective devices in series between the main switchboard and the individual elevator overcurrent device, thus reducing the number of devices that must be selectively coordinated. This becomes more difficult when the multi-elevator panel is supplied via an automatic transfer switch will back-up service from an emergency generator.
f. It appears from a survey of the past editions of the NEC and supporting documents that this code article was originally established as a maintenance issue, but has since been recognized as a safety issue also; not one of electrical safety, but rather elevator occupant safety of not being trapped in an elevator between floors.
5. Request for Clarification:
a. Is it the intent to require selectivity of all overcurrent protective devices between the main switchboard and the individual elevator disconnecting means located in the elevator machine room? Note that this selectivity will be difficult to achieve when standby generation to the elevators via an Automatic Transfer Switch is provided?
b. Since elevator failure modes are typically of the higher impedance arcing fault variety, selectivity both with fuses and circuit breakers is achievable because the probability of a bolted fault in this type of equipment is insignificant; therefore, fault currents in the instantaneous range of circuit breakers are not realistic. Is this statement considered valid by the code making panel?
c. If the answer to Question b above is no, is it the intent of this code article to only allow fuses for all overcurrent protective devices between the main switchboard and the individual elevator disconnecting means located in the elevator machine room?
6. History of the NEC re Elevators:
a. NFPA 70 - A92 Technical Committee Report or TCR Para 12-84-(620-51(a)) states that the reason for adding this article is essentially for maintenance purposes. "Should an electrical fault occur in the machine equipment room for the elevator, it is possible to not only trip the breaker or open the fuses in the machine room disconnecting means, but to also trip the breaker or open the fuses in the building's main distribution equipment. When the serviceman arrives to troubleshoot, he finds that he must locate the main distribution equipment to restore power, then he can begin to resolve the problem with the elevator equipment. Valuable time is lost to restore the elevators. The requirement for selective coordination will solve this dilemma. The fault will be localized."
b. NPFA 70 - 1993 Article 620-51(a) Type: Added new Para. 2 which states "The fuses or circuit breakers provided for in the disconnecting means shall be selectively coordinated with any and all other supply side overcurrent protective devices."
c. NFPA 70 - A95 Report on Proposals
(1) ROP 12-62-(620-51) which was accepted in principal amends Para. 2 to (a) Type to read "Where more than one driving machine disconnecting means is supplied by a single feeder, the overcurrent protective devices in each disconnecting means shall be selectively coordinated with an other supply side overcurrent protective devices."
Substantiation (for no longer being applicable to single elevator installations): Single elevator installations are typically located in low rise structures and the electrical service is close to the elevator equipment and would not create a problem for elevator maintenance personnel in locating supply side overcurrent devices. Also simplified compliance by use of all available types of overcurrent devices.
NEC 620-51(d), Identification & Signs, was added to set a requirement for labeling as follows, "The disconnecting means shall be provided with a sign to identify the location of the supply

side overcurrent protective device." The reason for this requirement was to "assist elevator mechanics to troubleshoot and help locate supply side overcurrent protective device in case of power loss."

Panel Action: Accept in Principle to "Relocate the second paragraph of Section 620-51(a) of Proposal 12-62 to become a new Section 620-62 titled "Selective Coordination."

(2) ROP 12-63-(620-51(a)): Proposed that the second paragraph with regard to elevator selectivity was a design consideration and was not a provision "considered necessary for safety". The panel rejected this proposal on the basis that this is a safety issue. "Restoration of elevator service is a safety concern, when elevators are stopped between floors."

PANEL ACTION: Reject.

PANEL STATEMENT: The proposal is a design consideration. The submitter has not provided definitive technical substantiation that a problem exists with the current language. Request for clarification of provisions of the NEC should be submitted to the proper offices (NFPA Headquarters) and are not considered part of a code proposal.

(Log #978)

12- 62 - (620-85): Reject

SUBMITTER: Dan Leaf, Palmdale, CA

RECOMMENDATION: Revise to read as follows:

Ground-fault Circuit-Interrupter Protection for Personnel. Each 125-volt, single-phase 15- and 20-ampere receptacle installed in pits, on elevator car tops, and in escalator and moving walk wellways shall be of the ground-fault circuit-interrupter type or be supplied through an adjacent readily accessible ground-fault circuit interrupter type receptacle that is in the same location.

SUBSTANTIATION: This would be a practical and safe alternative where more than one receptacle is installed in the same location.

PANEL ACTION: Reject.

PANEL STATEMENT: The wording "supplied through an adjacent readily accessible GFCI type receptacle...." is not in accordance with the NEC Style Manual ('adjacent' is vague and unenforceable). The submitter has not provided adequate technical substantiation to document problems with the current language.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Kelly, Laney

(Log #1734)

12- 63 - (620-85): Accept

SUBMITTER: Nick Marchitto, Otis Elevator Co./Rep. Nat'l Elevator Industry Inc. (NEII)

RECOMMENDATION: Revise first paragraph as follows:

620-85. Ground-Fault Circuit-Interrupter Protection for Personnel. Each 125-volt, single phase, 15- and 20-ampere receptacle installed in pits, in hoistways, on elevator car tops, and in escalator and moving walk wellways shall be of the ground-fault circuit-interrupter type.

Second and third paragraphs: Same as present wording.

SUBSTANTIATION: To provide GFCI protection for personnel working in the hoistway on elevator equipment furnished with "machine room-less" type systems. Requiring locally reset GFCI receptacles, will enhance safety by not having the worker climb out of the hoistway to reset a GFCI protected circuit at its protection source. This is the same reasoning as for requiring local reset devices for elevator pits, elevator car tops, and escalator and moving walk wellways.

PANEL ACTION: Accept.

(Log #1890)

12- 66 - (625-17): Accept in Principle
SUBMITTER: Frank J. Cihak, American Public Transit Assoc./Rep. Nat'l Electric Transportation Infrastructure Working Council
RECOMMENDATION: Revise to read as follows:
625.17. Cable. The electric vehicle supply equipment cable shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Article 400 and Table 400-4. Ampacities shall be as specified in Table 400-5(a) for No. 10 and smaller and Table 400-5(B) for No. 8 and larger. The overall length of the cable shall not exceed 25 ft (7.63 m). Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and optical fiber cables, shall be permitted. Where the electric vehicle supply equipment cable is suspended from overhead, is longer than 25 feet (7.63 m), or is intended for portable use within the facility, it shall be equipped with a cable management system that is identified and listed as suitable for the purpose.
SUBSTANTIATION: The original intent of this language was to allow access to EV supply equipment located in residential garages/carports and in public parking spaces without creating a tripping hazard or circumstances that would lead to cord damage. The proposed revision recognizes that at commercial facilities and fleet operations EV supply equipment may be used to serve multiple parking spaces. The original intent can be preserved, while permitting multiple parking spaces to be served, using cord management equipment that is listed as suitable for this type of application to allow greater flexibility for site planning under these conditions.
PANEL ACTION: Accept in Principle.
Revise to read as follows:
"625.17. Cable. The electric vehicle supply equipment cable shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Article 400 and Table 400-4. Ampacities shall be as specified in Table 400-5(a) for No. 10 and smaller and Table 400-5(B) for No. 8 and larger. The overall length of the cable shall not exceed 7.5 m (25 ft). Where the electric vehicle supply equipment cable is suspended from overhead or is intended for portable use within the facility, the overall length of the cable shall be permitted to exceed 7.5 m (25 ft) if equipped with a cable management system that is identified and listed as suitable for the purpose. Other cable types and assemblies listed as being suitable for the purpose, including optional hybrid communications, signal, and optical fiber cables, shall be permitted."
PANEL STATEMENT: The proposal has been editorially revised for clarity. The revised language should meet the submitter's intent.

NOT RETURNED: 2 Kelly, Laney

(Log #4252)

12- 67 - (625-29(d)): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
RECOMMENDATION: Reformat the numbered paragraphs (and unnumbered ones) with coherent numbers and titles, and then delete the final paragraph, as follows:
(1) Table Values. For supply voltages and currents specified in Table 625-29(d), the minimum...
(2) Other Values. For supply voltages and currents other than specified in Table 625-29(d), the minimum...
(3) Engineered Systems. For an electric vehicle supply equipment ventilation system...
(4) Supply Circuits. The supply circuit to the mechanical ventilation equipment...
Delete the last paragraph.
SUBSTANTIATION: This proposal enhances editorial clarity and removes conflicting requirements due to a panel error in the 1999 cycle. What would become the last sentence in (4) is the correct wording because it references Section 625-15(c) which has more detailed marking rules than the old exception in the 1996 NEC. This exception survives as a conflicting final paragraph, and should be deleted.
PANEL ACTION: Accept.

Note: The Technical Correlating Committee directs that the Panel revise the Panel Action relative to the Fine Print Note in accordance with 3.1 of the NEC Style Manual. This action will be considered by the Panel as a Public Comment.
NOTE: The following proposal consists of Comment 12-56 on Proposal 12-95 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 12-95 was:
Revise text:
(New text shown by underline ; deleted text show by strikethrough)
630-11 Ampacity of Supply Conductors. The ampacity of conductors for ac transformers and dc rectifier arc welders shall be as follows:
(a) Individual Welders. The ampacity of the supply conductors shall not be less than the 11eff value on the rating plate. Alternatively, if the I1eff is not given, the ampacity of the supply conductors shall not be less than the current values value determined by multiplying the rated primary current in amperes given on the welder nameplate rating plate and the following factor based upon the duty cycle or time rating of the welder.
Duty Cycle
(percent).....100 90 80 70 60 50 40 30 20 orless
Multiplier for non-motor
-generator arc welders.....1.00 .95 .89 .84 .78 .71 .63 .55 .45
Multiplier for motor-generator
arc welders..... 1.00 .96 .91 .86 .81 .75 .69 .62 .55
For a welder having a time rating of 1 hour, the multiplying factor shall be 0.75
(b) Group of Welders. The ampacity of conductors that supply a group of welders shall be permitted to be less than the sum of the currents, as determined in accordance with (a) above, of the welders supplied. The conductor rating shall be determined in each case according to the welder loading based on the use to be made of each welder and the allowance permissible in the event that all the welders supplied by the conductors will not be in use at the same time. The load value used for each welder shall take into account both the magnitude and the duration of the load while the welder is in use.
(FPN): Conductor ratings based on 100 percent of the current, as determined in accordance with (a) above, of the two largest welders, 85 percent for the third largest welder, 70 percent for the fourth largest welder, and 60 percent for all remaining welders, can be assumed to provide an ample margin of safety under high-production conditions with respect to the maximum permissible temperature of the conductors. Percentage values lower than those given are permissible in cases where the work is such that a high-operating duty cycle for individual welders is impossible.
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual relative to the use of mandatory language in the Fine Print Note.
SUBSTANTIATION: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3-4.2 and 3-4.3 of the Regulations Governing Committee Projects.
PANEL ACTION: Accept in Principle.
In 630-11 (FPN) revise as follows:
Replace "are permissible" in the last sentence with "can be considered".
PANEL STATEMENT: The panel action should satisfy the request of the TCC by removing mandatory language from the FPN.

(Log #979)

12- 74 - (630-13): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
~~A~~ An individual disconnecting means shall be provided in the supply circuit for each arc welder that is not equipped with a disconnect mounted as an integral part of the welder.
The disconnecting means shall be a switch or circuit breaker and its current rating shall not be less than ~~that necessary to accommodate overcurrent protection as specified under Section 630-12~~ 115 percent of the welder nameplate current rating.
SUBSTANTIATION: Editorial. An individual disconnect seems to be the intent, although a feeder disconnect with suitable overcurrent protection could be deemed to comply since a feeder is part of the supply circuit. Section 630-33 is more clear in indicating an individual disconnect is required. Present wording infers a fusible switch or circuit breaker must be used, whereas a nonfusible switch or molded-case switch should be suitable if supplied by a feeder with overcurrent protection in accordance with Section 630-12. The overcurrent protection specified in Section 630-12 could be 200 percent or any value less that function satisfactorily, and present wording is somewhat nonspecific. The proposed ampere rating correlates with Section 430-110(a).
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter has not provided adequate technical substantiation to document problems with the current language.

(Log #3097)

12- 75 - (630-15): Accept in Principle in Part
Note: It was the action of the Technical Correlating Committee that this Proposal be referred to Code-Making Panel 5 for comment.
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Add the following subarticle:
630-15. Grounding of Welding Secondary Circuit. When grounding of a welding secondary circuit is required by local regulation or when needed to minimize electromagnetic interference, such grounding shall be done by means of a direct connection from the welding workpiece to ground. Grounding by means of a direct connection from a secondary (output) terminal of a welding power source to the equipment grounding conductor is not permitted.
FPN: Grounding may also be done to a welding table or fixture, upon which the welding workpiece may be placed.
SUBSTANTIATION: RATIONALE: The intentional grounding of the secondary circuit work terminal of arc welding equipment by the method as stated in 11.2.3.3 of ANSI/ASC Z49.1-1998 introduces a potential safety hazard to the equipment grounding conductors of the

utility supply system. This method permits a direct connection between the work terminal of a welding power source and the power source frame.

The potential safety hazard is created when the welding work lead is not connected to the work piece, thus causing welding current to flow through the connections intended only for equipment grounding. Even with the connection of the welding work lead to the work, a parallel welding current path exists through the primary equipment ground connection to the work piece. This additional current path still leaves the potential for degradation of the equipment grounding system.

The original intent of 11.2.3.3 of ANSI/ASC Z49.1-1998 was to limit voltages of the secondary circuit due to lightning, line voltage surges, or unintentional contact with higher primary voltages because of transformer isolation failure. However, the grounding method proposed in 11.2.3.3 of ANSI/ASC Z49.1-9 does not follow the recommended practices of subarticles 250-20 and 250-30 of the NEC. These two subarticles, in summary, call for the grounding electrode conductor of the separately derived system, sized according to subarticle 250-66, to be connected to a grounding electrode as specified in subsection 250-30(a)(3). This method of grounding, as proposed by the NEC, eliminates the possibility of unwanted or excessive current flow in the equipment grounding conductor connections that are provided with the primary conductor connections of the transformer.

NEMA does not advocate the adoption and use of the NEC grounding methods. Figure 1 represents the basic NEC requirements necessary if work terminal grounding is done at the machine. Figure 2 illustrates the preferred method for grounding the work piece advocated by NEMA. If the NEC specifies the grounding method depicted in figure 2 as the preferred method, and disallows the method referenced in 11.2.3.3 of ANSI/ASC Z49.1-9, then the integrity of the equipment grounding conductor system will be assured.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept in Principle in Part.

Revise the proposal to read as follows:

"630-15 Grounding of Welder Secondary Circuit. The secondary circuit conductors of an arc welder, consisting of the electrode conductor and the work conductor, shall not be considered as premises wiring for the purpose of applying Article 250."

The panel did not accept the wording "as required by local regulation" or the entire fine print note.

PANEL STATEMENT: The submitter points out one of many problems that can occur if the secondary of an arc welder is considered a separately derived system, and the secondary conductors are considered premises wiring. There are two unique conditions that are normal in the arc welding process, which would be considered abnormal in equipment for general use. First, the secondary current, which flows normally during the arc welding process, would be considered a fault on equipment for general use. The arc welding process essentially short circuits the secondary, and this short circuit is part of the normal process, rather than a fault. Secondly, the workpiece, under equipment for general use standards, would be considered a non-current carrying metallic part likely to become energized. Under welding conditions, the workpiece becomes part of the secondary circuit.

If the welder secondary is considered a separately derived system, and the secondary conductors are considered premises wiring, then the following dilemma occurs. Article 630 modifies the overcurrent protection requirements for arc welders to prevent nuisance overcurrent device operation during normal welding conditions. Article 630 is presently silent on welder secondary grounding, so it could be construed that the grounding requirements of Chapters 1-4 apply without modification. The submitter's Figure 1 shows the application of the Chapter 1-4 requirements under these conditions. In many instances, the workpiece will be part of the metallic building structure, or will be electrically bonded to the metallic building structure. The premise of the Chapter 1-4 grounding and overcurrent protection methods is that contact between an ungrounded circuit conductor, and a grounded item represents a ground fault which should cause an overcurrent device to operate to clear the fault. Under arc welding conditions, contact between the ungrounded welding electrode conductor and the grounded workpiece is not a fault, and the overcurrent device will not operate. Under these conditions, objectionable current may flow in the equipment grounding conductor.

The solution proposed by the submitter will allow grounding of the workpiece without causing objectionable current flow in the equipment grounding conductors. Unfortunately, part of this solution is beyond the scope of the Code. According to 90-2, the scope of the Code is limited to installation requirements. In most instances, the connection of the work terminal conductor to the workpiece will be a work practice, rather than an installation, and as such, will be out of the jurisdiction of the Code. The panel action will remove the current barriers in the Code that could be interpreted as disallowing the grounding method proposed by the submitter.

12- 77 - (630-41): Reject

SUBMITTER: Ravindra H. Ganatra, Alcan Cable

RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested."

SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.

[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]

PANEL ACTION: Reject.

ABSTENTION: 1

EXPLANATION OF ABSTENTION:

CAUDILL: The Society of the Plastics Industry abstains for the following reason:

"The plastics industry could not reach a consensus position on the proposals or Panel Actions taken at the Hilton Head meeting."

(Log #4148)

16- 2 - (640-3(l)): Accept

Note: The Technical Correlating Committee directs that the Action on this Proposal be rewritten to comply with the NEC Style Manual to delete the reference to Article 445. This action will be considered by the Panel as a Public Comment.

SUBMITTER: William Keezer, Bose Corp./Rep. Nat'l Systems Contractors Assn. (NSCA)

RECOMMENDATION: Add new subsection (l) to Section 640-3 as follows:

(l) Generators. Generators shall be installed in accordance with Article 445. Grounding of portable and vehicle-mounted generators shall be in accordance with Section 250-34.

SUBSTANTIATION: Problem:

1) If the reference to Article 445 is deleted from the proposed revision of 640-42(d), then the intent of that section to provide guidance on the proper utilization of portable and vehicle-mounted generators is lost.

2) If the reference to Article 445 is not deleted from the proposed revision of 640-42(d), this reference is still better located in Section 640-3 where all other section references are located.

3) Special grounding provisions for portable and vehicle-mounted generators used for audio systems are not readily apparent within Article 640.

Substantiation:

1) Inquiries to NSCA staff on the use of portable and vehicle-mounted generators suggest that even when Article 445 is cited, Section 250-34 is frequently hard to find or overlooked. This proposal remedies that situation.

2) Section 640-3 lists "Locations and Articles" applicable to circuits and equipment used for audio systems. This is the most appropriate location for references on the use of portable and vehicle-mounted generators.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #CP1603)

16- 2a - (640-6): Accept

SUBMITTER: CMP 16

RECOMMENDATION: Revise text to read as follows:

"Mechanical Execution of Work. Equipment and cabling shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceiling and sidewalls shall be supported by the structural components of the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be attached to structural components at intervals not exceeding 1.52 m (5 ft) and within 305 mm (12 in.) from every cabinet, box or fitting by straps, staples, hangers or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with Section 300-4(d).

Also, delete the Fine Print Note."

SUBSTANTIATION: This proposal provides additional rules for the mechanical execution of the work. Since there are additional rules, the fine print note is not necessary. This provides parallel requirements to those used in Articles 725, 760, 770, 800, 820, and 830.

PANEL ACTION: Accept.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

JOHNSON: The requirement to support cables every 5 ft is overly specific. Repeatedly, I have heard in Panel meetings that the Code is not intended to serve as an Installation Manual. While attachment every 5 ft may be a good idea in many cases, it also may be overly restrictive and unnecessary in other cases.

(Log #3660)

16- 3 - (640-6): Accept

SUBMITTER: Melvin J. Wierenga, Wierenga & Assoc.

RECOMMENDATION: Delete the FPN associated with this section.

SUBSTANTIATION: Problem: The standards listed contain insufficient information to determine accepted industry practice for systems and equipment included in Article 640.

Substantiation: A detailed review of ANSI/EIA/TIA/568A-1995, ANSI/EIA/TIA/569-1990 , and ANSI/EIA/TIA/570-1991 was completed by the submitter and no significant information, guidance, or directives were found, that would be helpful to a user of this Article of the Code. These standards were developed by the telecom and computer industries. They provide the details covering telecommunication infrastructure such as cable pathways, equipment spaces, telephone grounding/bonding, and telecommunication administration. They are excellent standards but they do not address typical cabling installation issues such as:

(a) how to properly pull wire(s) above a lay in ceiling.

(b) when and where to support the wire in a building structure.

(c) how to dress various types of audio signal wires coming into and within an equipment cabinet.

(d) how and where to set up wire reels for riser cables in tall structures.

(e) how and where to dress audio speaker wire along a steel beam in a gymnasium or factory.

(f) what to watch out for when pulling a cable into a raceway.

These standards are purported to be the concept standards for guiding the users of the Code in determining appropriate mechanical execution of work and determination of acceptable industry practices. However, such is not the intent of the standards. For those who do not have a set of the standard available, the submitter has provided an Appendix that summarizes each section of each standard. The appendix will give you an overview of the contents of each section of each standard and enable you to gain a better understanding of what the standards cover.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept.

PANEL STATEMENT: The proposed recommendation has been incorporated by the panel action on Proposal 16-2(a).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 20

NEGATIVE: 2

EXPLANATION OF NEGATIVE:

LANNI: After reviewing the NECA index No. 5037, I realized that there are very useful National Electrical Installation Standards available and a Fine Print Note is the appropriate way to guide the code user. I also feel that the panel did satisfy the original submitter when the Fine Print Note was incorporated into the code. Improving the references, instead of removing the Fine Print Note, would improve our original work. Installation documents are being produced all the time partially in response to our note in the code.

The panel could only answer one of the Submitter's concerns, namely, "when and where to support the wire in a building structure." Other issues are left unanswered. Good workmanship is an important component of a safe installation, but the code cannot address all these issues and other documents are more suited for the purpose.

ROMLEIN: It is clear to most knowledgeable individuals that all of the existing stove pipe transports associated with voice, video, fire alarm, industrial supervision, security and control information transports are converging on the data transport infrastructure. To a very large degree, the building wiring standards published as ANSI/TIA/EIA Buiding Wiring Standards have facilitated this migration.

One example of this migration to a uniform transport is a press release that shows the FCC using TIA standards as quality reference for wiring to access existing and advanced telecom services.

I feel that it is a disservice to our industry not to apprise our colleagues with information that will enable them to gain the the knowledge and provide the services needed.

Note: Supporting material available upon request at NFPA headquarters.

(Log #4020)

16- 4 - (640-6): Reject

SUBMITTER: Robert Jensen, dbi-Telecommunications Infrastructure Design/Rep. Building Industry Consulting Service Int'l

RECOMMENDATION: Revise the FPN to read: "One way to determine accepted industry practice is to refer to nationally recognized standards such as Commercial Building Telecommunications Cabling Standard, ANSI/EIA/TIA 568-A-1995; Commercial Building Standard for Telecommunications Pathways and Spaces, ANSI/TIA/EIA 569-A-1997; and Residential ~~and Light Commercial~~ Telecommunications Cabling ~~Wiring~~ Standard, ~~ANSI/EIA/TIA 570-1991~~ ANSI/EIA/TIA 570-A-1999, ANSI/NECA/BICSI 568 or other ANSI-approved installation standards."

SUBSTANTIATION: A revision to the standard number and the title for residential cabling has been updated. Another standard is currently under review that will be focused at the installation of telecommunications cabling and connectors and will become an ANSI standard within the next year.

PANEL ACTION: Reject.

PANEL STATEMENT: Section 640-6 has been revised to remove the FPN and provide specific installation requirements. A FPN is no longer necessary. Refer to the panel action and statement on Proposal 16-2(a).

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

I also feel that the panel did satisfy the original submitter when the Fine Print Note was incorporated into the code. Improving the references, instead of removing the Fine Print Note, would improve our original work. Installation documents are being produced all the time partially in response to our note in the code. The panel could only answer one of the Submitter's concerns, namely, "when and where to support the wire in a building structure." Other issues are left unanswered. Good workmanship is an important component of a safe installation, but the code cannot address all these issues and other documents are more suited for the purpose.

(Log #1100)

16- 5 - (640-7(a)): Accept

SUBMITTER: James M. Daly, BICC General

RECOMMENDATION: Change "No. 14" to "14 AWG".

SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.

AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.

This is one of a series of proposals to make this change throughout the Code.

PANEL ACTION: Accept.

16- 7 - (640-9(c)): Accept in Principle

SUBMITTER: William Keezer, Bose Corp./Rep. Nat'l Systems Contractors Assn. (NSCA)

RECOMMENDATION: The submitter proposes that the second, third, and fourth paragraphs of Section 640-9(c) be deleted as follows:

(c) Output wiring and Listing of Amplifiers. Amplifiers with output circuits carrying audio-program signals shall be permitted to employ Class 1, Class 2, or Class 3 wiring where the amplifier is listed and marked for use with the specific class of wiring method. Such listing shall assure the energy output is equivalent to the shock and fire risk of the same class as stated in Article 725. Overcurrent protection shall be provided and shall be permitted to be inherent to the amplifier.

~~Audio circuits wired using Class 1 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 1 wiring methods.~~

~~Audio circuits wired using Class 2 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 2 wiring methods.~~

~~Audio circuits wired using Class 3 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 3 wiring methods.~~

FPN No. 1: Amplifiers for Fire Protective Signaling Systems, ANSI/UL 1711-1994 contains requirements for the listing of amplifiers used for fire alarm systems in compliance with NFPA 72-1996, National Fire Alarm Code.

FPN No. 2: Examples of requirements for listing amplifiers used in residential, commercial, and professional use are found in Commercial Audio Equipment, ANSI/UL 813-1992, Professional Video and Audio Equipment, ANSI/UL 1419-1992, Audio-Video Products and Accessories, ANSI/UL 1492-1992, or Audio/Video and Musical Instrument Apparatus for Household, Commercial, and Similar Use, ANSI/UL 6500-1996.

SUBSTANTIATION: Problem:

1) These three paragraphs were added to the original proposal during CMP 16's meeting to act on comments during the 1999 Code cycle. These requirements go beyond the scope and intent of the original proposal and are not based upon any scientific evidence that there exists a shock or fire initiation hazard that would be mitigated by these requirements. The proper scientific reference for clarification of shock hazard under these conditions is IEC 60479-1, the same reference used by the submitter for substantiation of their original proposal.

2) Such an onerous and unsubstantiated change to the NEC should have been allowed public review before incorporation into the Code. Neither industry nor the original submitter was allowed to provide written objection to this change before publication. This appears to be inconsistent with the public review requirements of the consensus code process.

3) Class 2 audio circuits and Class 2 circuits in accordance with Article 725 have been permitted in the same enclosure or raceway ever since the Class 2 category for an audio circuit was established in 1956. No Code Panel member has submitted a single example of an injurious accident resulting from this 43-year old practice. As has already been substantiated before the CMP 16 committee, the 20

percent increase in permitted open-circuit voltage for a Class 2 audio circuit does not represent a significant or unacceptable decrease in circuit safety. To remove this formerly allowable wiring practice is unwarranted in the face of the evidence, and a significant financial penalty for the installer and premises owner without a commensurate improvement in safety.

Substantiation for Change:

1) Underwriters Laboratories (UL) has revised UL 813, Commercial Audio Equipment, in accordance with the provisions of the first paragraph of Section 640-9(c). In so doing, UL has determined that audio circuits wired in accordance with the listing requirements of that standard and the manufacturer's instructions are equivalent in shock and fire risk to a Class 1, 2, or 3 circuit as described in Article 725.

2) The Code currently permits circuits defined in Article 725 to co-mingle with other circuits determined to be of equivalent safety. See Subsection 725-54(b)(5). Many of the enumerated circuits in this subsection commonly exist with audio circuits in the same facility. They should not be prohibited from existing in the same enclosure or raceway. As with audio circuits defined in Section 640-9(c), the operating parameters of these circuits are not defined in Article 725 either, yet they are deemed of equivalent safety.

3) Class 1 and Class 3 audio amplifier output circuits as defined in UL 813 do not deviate from the voltage limits established for equivalent signal circuits as specified in Article 725. When these circuits are properly evaluated in accordance with the concept of crest factor, audio amplifier output circuits are inherently safer from shock hazard, not more dangerous, than equivalent Article 725 circuits.

4) The first paragraph of Section 640-9(c) states that audio amplifier output circuits shall be permitted to employ Class 1, Class 2, or Class 3 wiring methods. The deletion of Paragraphs 2, 3, and 4 does not absolve such circuits from the circuit separation requirements contained in those methods (those of Article 725). Eliminating these three paragraphs does not create the potential for shock or fire hazard from intermixing of different classes of circuits because, in accordance with the requirements of the first paragraph, audio and non-audio circuits of the same class designation ARE the same class from an installation, fire, and shock hazard point of view.

5) Section 640-9(c), first paragraph, specifically states "Class 1, Class 2, or Class 3 wiring," as well as "class of wiring method." The intent that is clear to any competent audio system installer is that both the class of wire, as well as the methods of installation permitted and prohibited for that class are applicable. Section 725-25 addresses Class 1 methods, and Section 725-52 addresses methods and materials for Class 2 and Class 3. These sections define in exquisite detail when different classes of circuits can and cannot be intermingled, all applicable to audio amplifier output circuits classified by UL as Class 1, 2, or 3.

6) Section 725-52 "Wiring methods and materials on the load side..." requires that conductors be installed in accordance with Sections 725-54 and 725-61. Therefore, concerns about separation from electric light, power, Class 1, etc. are all addressed. The first paragraph of 640-9(c) does not selectively choose which aspects of Class 1, 2, or 3 wiring methods can be ignored.

PANEL ACTION: Accept in Principle.

PANEL STATEMENT: Refer to the panel action on Proposal 16-8.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #4146)

16- 8 - (640-9(c)): Accept

SUBMITTER: William Keezer, Bose Corp./Rep. Nat'l Systems Contractors Assn. (NSCA)

RECOMMENDATION: The submitter proposes that the second, third, and fourth paragraphs of Section 640-9(c) be deleted and replaced with new text as follows:

(c) Output Wiring and Listing of Amplifiers. Amplifiers with output circuits carrying audio-program signals shall be permitted to employ Class 1, Class 2 or Class 3 wiring where the amplifier is listed and marked for use with the specific Class of wiring method. Such listing shall assure the energy output is equivalent to the shock and fire risk of the same Class as stated in Article 725. Overcurrent protection shall be provided and shall be permitted to be inherent to the amplifier.

~~Audio circuits wired using Class 1 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 1 wiring methods.~~

~~Audio circuits wired using Class 2 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 2 wiring methods.~~

~~Audio circuits wired using Class 3 wiring methods shall not occupy the same raceway or enclosure with other than audio circuits wired using Class 3 wiring methods.~~

Audio amplifier output circuits wired using Class I wiring methods shall be considered equivalent to Class I circuits and be installed in accordance with Section 725-25, where applicable.

Audio amplifier output circuits wired using Class 2 or Class 3 wiring methods shall be considered equivalent to Class 2 or Class 3 circuits respectively. They shall use conductors insulated at not less than the requirements of Section 725-71, and shall be installed in accordance with Sections 725-54 and 725-61.

FPN No. 1: Amplifiers for Fire Protective Signaling Systems ANSI/UL 1711-1994 contains requirements for the listing of amplifiers used for fire alarm systems in compliance with NFPA 72-1996 National Fire Alarm Code.

FPN No. 2: Examples of requirements for listing amplifiers used in residential, commercial and professional use are found in Commercial Audio Equipment ANSI/UL 813-1992, Professional Video and Audio Equipment ANSI/UL 1419-1992, Audio-Video Products and Accessories ANSI/UL 1492-1992 or Audio/Video and Musical Instrument Apparatus for Household, Commercial, and Similar Use ANSI/UL 6500-1996.

SUBSTANTIATION: 1) The provisions of the paragraphs to be deleted create a financial and installation hardship for installers and customers of installed audio systems with no commensurate increase in safety. The traditional and well-accepted practice of allowing an amplifier output circuit which permits or requires a particular Class of wiring to occupy the same wireway or raceway as an equivalent Article 725 circuit is prohibited by these three paragraphs. This prohibition can even be interpreted as requiring the separation of these circuits from other nonamplifier audio circuits and audio control circuits of the same Class. No evidence has ever been presented to indicate that these constraints on circuit installation would have averted any documented case of injury or death resulting from the customary installation practices of code-compliant installers over the past 44 years.

2) The proposed additional text clarifies exactly which sections of Article 725 apply to the wiring methods and materials used for audio amplifier output circuits, and clearly states that an equivalency of these circuits to Article 725 circuits exists. The intent is to make sure that both circuit classes are treated in an identical manner and the same classes of both circuit types can be placed in the same enclosure, wireway or raceway.

Substantiation for Change:

1) The provisions of the paragraphs proposed to be deleted presume a shock or fire initiation hazard exists in audio amplifier output circuits which is unique from Class 1, 2, and 3 circuits as defined in Article 725. If such were the cases, then such circuits might correctly be segregated from circuits of different hazard potentials. After this text was entered into the code, UL and the majority of a CMP 16 task group have determined that there can be an equivalency such that the ouput of listed amplifiers may be considered equivalent to the same Class of circuit as defined in Article 725. This finding substantiates the proposed text deletion.

2) Underwriters Laboratories (UL) has revised UL 813, Commercial Audio Equipment in accordance with the provisions of the first paragraph of Section 640-9(c). In so doing, UL has determined that audio circuits wired in accordance with the listing requirements of that standard and the manufacturer's instructions are equivalent in shock and fire risk to a Class 1, 2 or 3 circuit as described in Article 725. This action substantiates that UL believes that the output of listed and labeled amplifiers does not represent a safety risk unique from classic Article 725 circuits of the same class designation. UL is by far the best qualified organization represented on the Technical Committee for having an innate understanding of the unique nature of audio circuits.

3) Class 1 and Class 3 audio amplifier output circuits as defined in UL 813 do not deviate from the voltage limits established for equivalent signal circuits as specified in Article 725. When these circuits are properly evaluated in accordance with the concept of crest factor, audio amplifier output circuits are inherently safer from shock

hazard, not more dangerous, than equivalent Article 725 circuits. For this reason, the submitter believes there should be no controversy about eliminating the segregation requirements from Class 1 and Class 3 audio amplifier output circuits. Based upon UL's findings and historical research, integral overcurrent protection adequate for protection against realistic fire initiation hazards exists in all listed amplifiers (and is required by the first paragraph of 640-9(c).

4) It has been argued that the proposed text deletion would allow unbridled intermingling of amplifier audio output circuits with other amplifier audio output circuits of differing Classes as well as with classic Article 725 circuits of any Class. The submitter respectfully disagrees. Section 640-9(c), first paragraph, specifically states "Class 1, Class 2, or Class 3 wiring," as well as "class of wiring method." The intent that is clear to any competent audio system installer is that both the class of wire, as well as the methods of installation permitted and prohibited for that class are applicable. Section 725-25 addresses Class 1 methods, and Section 725-52 addresses methods and materials for Class 2 and Class 3. These sections define in exquisite detail when different classes of circuits can and cannot be intermingled. All are clearly applicable to audio amplifier output circuits classified by UL as Class 1, 2 or 3.

5) The proposed additional text is intended to provide clarification on circuit equivalency. It is proposed as code text but could be considered a candidate for in conclusion in the code as a fine print note without subverting the intent of the submitter. It is felt that clarification is necessary in order to undo the confusion created by the text of the 1999 code. This text also clearly addresses which parts of Article 725 are applicable, and which are not.

6) It has been argued that the first paragraph does not sufficiently clarify separation requirements from Class I and light and power circuits. The submitter respectfully disagrees. Section 725-52 "Wiring methods and materials on the load side... "requires that conductors be installed in accordance with Sections 725-54 and 725-61. Concerns about separation from electric light, power, Class I etc. are all addressed in 725-54. The first paragraph of 640-9(c) does not selectively choose which aspects of Class I, 2, or 3 wiring methods can be ignored. The proposed additional text clarifies that Section 725-54 is directly applicable.

7) Technical substantiation for the shock hazard characteristics of audio amplifier output circuits is contained in the following documents submitted as appendices to this proposal:

7.1) Memo to Lee Hewitt from Walter Skuggevig dated January 8, 1997 addressing the proposed content of 640-9(c). This document was distributed by Lee Hewit of UL to CMP 16 members who were current in the Spring of 1997. It is submitted for distribution to newer panel members who were not on the original distribution. This memo supports the findings reported in the technical paper Electrical Shock Hazard and Audio System Installation by William J. Keezer

7.2) Technical paper Electrical Shock Hazard and Audio System Installations by William J. Keezer dated 12/13/96. A document which analyzes the realistic risks of electrical shock from audio amplifier output circuits. This document includes 7 appendices, all of which were distributed to all attending CMP 16 members at the 1998 NEC Committee Report on Proposals Annual Meeting - Cincinnati, Ohio. It is submitted for distribution to newer panel members who were not on the original distribution. The appendices to this paper are enumerated below and included in this submittal.

Appendix A — Report on the World Wide Web Search for Audio Amplifier Shock Hazards

Appendix B — References for Terminology and Use of the Term "Crest Factor."

Appendix C — Unedited Figure 1, and Edited Figures 2, 10, and 11 from IEC 479-1, third edition, 1994

Appendix D — Symmetrical and Asymmetrical Body Contact Areas for Audio System Hazard Analysis

Appendix E — Comparisons of Current and Proposed Amplifier Output Conditions

Appendix F — Finger Contact Area for Stripped Audio Cable

Appendix G — Electrical Shock and Audio Systems Installations and Their Acoustic Feedback

7.3) Copies of changed sections of UL 813 Commercial Audio Amplifiers, Seventh edition are submitted. These changes indicate that the safety issues of tis proposal have been adequately addressed.

8) UL was asked if it could provide a report on the fire initiation hazards of amplifier output circuits. UL could not supply a report because no history of such events exists in ULs records. This finding was further substantiated in Appendix A of the technical paper Electrical Shock Hazard and Audio System Installations. It is well known that it is possible to terminate any circuit (including a Class 2 circuit or a battery circuit exempt from Class 2 listing) in such a manner as to initiate a fire. But such a fire of not due to improper installation or faulty overcurrent protection, but to inappropriate or defective equipment at the point of circuit termination.

9) It has been argued that if a Class 2 audio amplifier output circuit is allowed in the same raceway or enclosure with other "Article 725" Class 2 circuits, a potential for damage to equipment exists should a wiring fault occur, especially due to inadequate dielectric strength of the cable. The submitter contends that this is an argument without merit or basis in code. UL has determined that Class 2 audio amplifier output circuits are of equivalent safety to "Article 725" Class 2 circuits without qualification. That determination can only address electrical performance characteristics as they pertain to life safety. No currently listed Class 2 source of power is required by the Code or by its listing to ensure that no functional damage will occur to a Class 2 device as a result of a wiring fault between circuits. Numerous Class 2 devices operating on a 3 volt supply could be damaged by 6 volts, 6 volt devices by 12 volts, a 12 volt DC device by a 12 AC supply, and all such devices might be irreparably damaged by a 24 volt listed supply. The code has no mandate to ensure that Class 2 devices remain functional under all conditions of faulty installation or cable.

Note: Supporting material is available for review at NFPA Headquarters.

PANEL ACTION: Accept.

VOTE ON PANEL ACTION:

AFFIRMATIVE: 22

(Log #4147)

16- 9 - (640-9(c)): Reject

SUBMITTER: William Keezer, Bose Corp./Rep. Nat'l Systems Contractors Assn. (NSCA)

RECOMMENDATION: The submitter proposes that a paragraph be added to Section 640-9(c) as follows:

Audio amplifiers permitted to employ Class 2 or Class 3 wiring methods for their output circuits shall be permitted to specify the use of Power Limited Fire Alarm (PLFA) wiring and wiring methods when the amplifier is used in a voice/alarm or combination system in accordance with NFPA 72, 1999 National Fire Alarm Code. PLFA audio amplifier output circuits shall be installed in accordance with Sections 760-41(d), 760-42, 760-52, 760-54, 760-61 and 760-71 as applicable.

SUBSTANTIATION: 1) When an amplifier is used in a voice/alarm or combination system in accordance with NFPA 72, 1999 National Fire Alarm Code, the safety concerns for appropriately wiring such systems should be equivalent to those concerns for the installation of a nonemergency audio systems. Since Article 760 clearly considers PLFA circuits to be of equivalent safety to a Class 3 circuit as defined in Article 725, then an audio amplifier output circuits listed as permitting Class 2 or Class 3 wiring methods is clearly safe enough to employ PLFA wiring methods. This proposal would allow the listing standard to specify that the use of PLFA wiring methods is permitted when an amplifier meets the Class 2 or Class 3 listing requirements of Section 640-9(c).

2) The methods for determining the safety of PLFA Circuits as defined in Tables 12(a) and 12(b) in Chapter 9 are inappropriate for determining the safety of audio amplifier output circuits. Recent developments in the area of voice/alarm performance requirements in NFPA 72, 1999 suggest that some voice/alarm performance requirements would be best met through the use of commercial audio system components suitably listed for the fire alarm use. This proposal would permit the use of PLFA wiring methods for audio amplifier output circuits when the audio amplifier output circuit has been found to be of equivalent safety to a Class 2 or Class 3 circuit as defined in Article 725. The sections of Article 760 that would be applicable to amplifier output wiring materials and methods are clearly specified to avoid confusion.

Substantiation for Change:

1) The proposed additional text clarifies that an amplifier permitted to employ class 2 or Class 3 wiring methods may be considered to be of equivalent safety to a PLFA circuit. It also clarifies which sections of Article 760 are applicable to the wiring of such a circuit.

2) This proposal is made because as certain types of places of assembly are expected to achieve the intelligibility requirements of a voice/alarm system as specified in NFPA 72, 1999 National Fire Alarm Code, a sound system designed for full bandwidth music and voice reproduction my be the only appropriate system for the delivery of an intelligible voice message. Since such a system must perform two roles with equal safety, this proposal allows appropriately listed amplifiers to employ wiring methods better suited to the installation of such systems. NPLFA wiring methods are unnecessary for amplifier/loudspeaker circuits when they are found to be equivalent in safety to a Class 3 circuit. NPLFA wiring methods are also excessively complex and expensive when installing loudspeakers that require adjustable positioning in multi-speaker clusters prior to commissioning. It should be obvious that this proposal does not and is not intended to preclude the use of circuit integrity cable or NPLFA wiring methods where appropriate for circuit integrity or the mechanical protection of circuits.

3) This proposal does not introduce a lower standard of electrical safety than is currently expected of any Class 3 or PLFA circuit today. Nor does it permit the installation of a PLFA circuit in any location where a PLFA circuit is not currently permitted. It only permits the logical use of PLFA wiring and wiring methods where Class 3 wiring would be permitted for the same purpose in a nonemergency audio system.

4) No listed amplifier would be permitted to allow the use of PLFA wiring and wiring methods unless the output terminations meet the requirements for Class 3 wiring methods. thus, even an amplifier which met Class 2 wiring requirements would be required to have touch-proof output circuit terminations in accordance with Class 3 wiring methods in order to allow PLFA wiring methods.

Observations: It is recognized, that, should this proposal be adopted, audio amplifiers listed for use with Class 2 or Class 3 in accordance with Section 640-9(c) would be recognized as clearly meeting the circuit safety concerns for PLFA circuits. This does not mean at such amplifiers should be used in a fire alarm audio system unless the amplifier also meets certain additional performance criteria such as is found in Amplifiers for Fire Protection Signaling Systems ANSI/UL 1711-1994. It is anticipated that listing requirements consequent to this proposal would be addressed by UL through appropriate revision of UL 1711 or other applicable listing standards. These changes would require performance criteria appropriate for a fire alarm system in order to permit output labeling signifying compliance. The amplifier listing requirement thus prevents an amplifier from being "permitted to specify the use" unless the listing standard has determined such use is permitted.

Note to Correlating Committee: While this proposal could be independently adopted, it is suggested that a companion proposal by the same submitter to add a Section 760-41(d) be correlated with this one. That proposal similarly addresses the same issue, and refers back to Section 640-9(c) to establish reciprocity between the two articles on this issue. If this proposal is adopted independent of adoption of the companion proposal, then the reference to Section 760-41(d) must be deleted from the proposed text.

PANEL ACTION: Reject.

PANEL STATEMENT: Type PLFA Cable is one of the cables used for a fire alarm system. The proposed application is not a fire alarm system. The use of Type PLFA Cable does not result in the installed system being a fire alarm system. The proposed recommendation could result in a conflict with requirements of NFPA 72.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

VOTE ON PANEL ACTION:

AFFIRMATIVE: 21

NEGATIVE: 1

EXPLANATION OF NEGATIVE:

WIERENGA: My reasons for a Negative vote are:

1. Building owners both private and governmental in the last few years have become increasingly aware of the need for intelligible voice evacuation systems. Large auditoriums, stadiums, and arenas because of their size and construction parameters now find that a sound system designed to accommodate their day to day functions may be the only logical and appropriate system to deliver that intelligible voice message.

2. This proposal does not introduce a lower standard of electrical safety. It permits the logical use of PLFA wiring and wiring methods where Class 3 wiring would be permitted for the same purpose in a non-emergency system.

3. No listed amplifier would be permitted to allow the use of PLFA wiring methods unless the output terminals met the requirements for Class 3 wiring methods (touchproof).

4. The Panel Statement says, "The proposed application is not a fire alarm system". If the house sound system is intended to provide voice intelligibility for a voice alarm or a combination system is it not part of the fire alarm system?

5. The Panel Statement in the last sentence states: "The proposed recommendation could result in a conflict with requirements of NFPA 72". The proposal states "when the amplifier is used in a voice/alarm or combination system in accordance with NFPA 72...auto amplifier output circuits shall be installed in accordance with Sections 750-41(d), 760-42, 760-52, 760-54, 760-61, and 760-71 as applicable". That does not look to me as being in conflict with NFPA 72, but rather an attempt to work in concert with NFPA and Article 760.

6. This proposal is an attempt to integrate rather than segregate. If an owner decides that they want to use their $500,000.00 sound system for a voice/alarm system or a combination system, what kind of wiring will be allowed if we do not clarify this matter? Does this Panel want the Authority Having Jurisdiction to decide for us? Or does CMP 16 want to provide guidance?

(Log #490)

16- 10 - (640-10(a)): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: 640-10(a) - change "5 ft (1.52 m)" to "1.5 m (5 ft)" in two places.

SUBSTANTIATION: The proposed revision complies with the NFPA 1M Manual of Style Section 4.1 with respect to the placement of units, i.e., to show the SI units as the preferred unit and the inch-pound units immediately following in parenthesis.

PANEL ACTION: Accept.

A. General

640-1. Scope This article covers equipment and wiring for audio signal generation, recording, processing, amplification and reproduction; distribution of sound, public address, speech-input systems, temporary audio system installations, and electronic organs or other electronic musical instruments. This also includes audio systems subject to Articles 517 Part F, 518, 520, 525, and 530.

(FPN No. 1): Examples of permanently installed distributed audio system locations include, but are not limited to, restaurant, hotel, business office, commercial and retail sales environments, churches and schools. Both portable and permanently installed equipment locations include, but are not limited to, residences, auditoriums, theaters, stadiums, movie and television studios. Temporary installations include, but are not limited to; auditoriums, theaters, stadiums (which use both temporary and permanently installed systems), and outdoor events such as fairs, festivals, circuses, public events and concerts.

(FPN No. 2): Fire and burglary alarm signaling devices are specifically not encompassed by this Article.

640-2. Definitions. For purposes of this article, the following definitions apply:

Audio Amplifier or Pre-Amplifier: Electronic equipment which increases the current and/or voltage potential of an audio signal intended for use by another piece of audio equipment. **Amplifier** is the term used to denote an audio amplifier within this Article..

Audio Autotransformer: A transformer with a single winding and multiple taps intended for use with an amplifier loudspeaker signal output.

Audio Signal Processing Equipment: Electrically operated equipment that produce and/or process electronic signals which, when appropriately amplified and reproduced by a loudspeaker, produce an acoustic signal within the range of normal human hearing (typically 20 - 20 kHz). Within this Article, the terms **equipment** and **audio equipment** are assumed to be equivalent to this term.

(FPN): This equipment includes, but is not limited to: loudspeakers; headphones; pre-amplifiers; microphones and their power supplies; mixers; MIDI (Musical Instrument Digital Interface) equipment or other digital control systems; equalizers, compressors and other audio signal processing equipment; audio media recording and playback equipment including turntables, tape decks and disk players (audio and multi-media), synthesizers, tone generators and electronic organs. Electronic organs and synthesizers may have integral or separate amplification and loudspeakers. With the exception of amplifier outputs, virtually all such equipment is used to process signals (utilizing analog or digital techniques) which have non-hazardous levels of voltage or current potential.

Audio System: Within this Article, the term audio system is interpreted to mean the totality of all equipment and interconnecting wiring used to fabricate a fully functional audio signal processing, amplification, and reproduction system.

Audio Transformer: A transformer with two or more electrically isolated windings and multiple taps intended for use with an amplifier loudspeaker signal output.

Equipment Rack: A framework for the support and/or enclosure of equipment. May be portable or stationary. See ANSI/EIA/310-D-92 *Cabinets, Racks, Panels and Associated Equipment*

Loudspeaker: Equipment which converts an AC electric signal into an acoustic signal. The term "speaker" is commonly used to mean loudspeaker.

Maximum Output Power: The maximum output power delivered by an amplifier into its rated load as determined under specified test conditions. This may exceed the manufacturer's rated output power for the same amplifier.

Mixer: Equipment used to combine and level match a multiplicity of electronic signals, such as from microphones, electronic instruments, and recorded audio.

Mixer-Amplifier: Equipment which combines the functions of a mixer and amplifier within a single enclosure.

Portable Equipment: Equipment fed with portable cords or cables intended to be moved from one place to another.

Powered Loudspeaker: Equipment which consists of a loudspeaker and amplifier within the same enclosure. Other signal processing may also be included.

Rated Load Impedance: The amplifier manufacturer's stated or marked speaker impedance into which an amplifier will deliver its rated output power. 2Ω, 4Ω, and 8Ω are typical ratings.

Rated Output Power: The amplifier manufacturer's stated or marked output power capability into its rated load.

Rated Output Voltage: For audio amplifiers of the "constant voltage type", this is the nominal output voltage when the amplifier is delivering full rated power. Used for determining approximate acoustic output in distributed speaker systems which typically employ impedance matching transformers. 25 volt, 70.7 volt and 100 volt are typical ratings.

Technical Power System: An electrical distribution system with grounding in accordance with Article 250-74, Exception 4, where the equipment grounding conductor is isolated from the premises grounded conductor except at a single grounded termination point within a branch circuit panelboard, the originating (main breaker) branch circuit panelboard, or at the premises grounding electrode.

Temporary Equipment: Portable wiring and equipment intended for use with events of a transient or temporary nature where all equipment is presumed to be removed at the conclusion of the event.

640-3. Locations and Other Articles. Circuits and equipment shall comply with (a), (b), (c), (d), (e), (f), (g), (h), (i), (j), and (k) below, as applicable.

(a) Spread of Fire or Products of Combustion. Section 300-21

(b) Ducts, Plenums, and other Air Handling Spaces. Section 300-22, where installed in ducts or plenums or other space used for environmental air.

(FPN): NFPA 90A, *Installation of Air Conditioning and Ventilation Systems*, Section 2-3.10.1 (a), Exception 3, permits listed loudspeakers, loudspeaker assemblies and their accessories to be installed in other spaces used for environmental air (ceiling cavity plenums).

(c) Cable Trays. Cable trays shall be used in accordance with Article 318

(FPN): See Section 725-61(c) for the use of Class 2, Class 3, and PLTC cable in cable trays.

(d) Hazardous (Classified) Locations. Equipment used in hazardous (classified) locations shall comply with the applicable requirements of Chapter 5.

(e) Places of Assembly. Equipment used in places of assembly shall comply with Article 518

(f) Theaters, Audience Areas of Motion Picture and Television Studios, and Similar Locations. Equipment used in theaters, audience areas of motion picture and television studios, and similar locations shall comply with Article 520.

(g) Carnivals, Circuses, Fairs and Similar Events. Equipment used in carnivals, circuses, fairs and similar events shall comply with Article 525.

(h) Motion Picture and Television Studios. Equipment used in motion picture and television studios shall comply with Article 530.

(i) Swimming Pools, Fountains, and Similar Locations. Audio equipment used in or near swimming pools, fountains, and similar locations shall comply with Article 680.

(j) Fire Alarm Systems. Fire alarm systems, multi-purpose fire alarm/page and-or fire alarm/music systems shall comply with Article 760.

(1) Such systems shall also comply with NFPA 72-1996 *National Fire Alarm Code*.

(2) Multi-purpose fire alarm/page and-or fire alarm/music systems shall additionally comply with NFPA 101-1994 *Life Safety Code*, Article 7-6.3.9, Exception No. 1.

(k) Antennas. Equipment used in audio systems which contain an audio or video tuner and an antenna input shall comply with Article 810. Wiring other than antenna wiring which connects such equipment to other audio equipment shall comply with this Article.

640-4. Protection of Electrical Equipment. Amplifiers, loudspeakers, and other equipment shall be so located or protected as to guard against environmental exposure or physical damage, such as might result in fire, shock, or personal hazard.

640-5. Access to Electrical Equipment Behind Panels Designed to Allow Access. Access to equipment shall not be denied by an accumulation of wires and cables that prevents removal of panels, including suspended ceiling panels.

640-6. Mechanical Execution of Work. Equipment and cabling shall be installed in a neat and workmanlike manner. Cables for installed systems shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use.

640-7. Grounding.

(a) General. Wireways and auxiliary gutters shall be grounded and bonded in accordance with the requirements of Article 250. Where the wireway or auxiliary gutter does not contain power-supply wires, the equipment grounding conductor shall not be required to be larger than No. 14 copper or its equivalent. Where the wireway or auxiliary gutter contains power-supply wires, the equipment grounding conductor shall not be smaller than specified in Section 250-95.

(b) Separately Derived Systems With 60 Volts to Ground. Grounding of separately derived systems with 60 volts to ground shall be in accordance with Section 530-72

(c) Isolated Ground Receptacles. Isolated grounding type receptacles shall be permitted as described in Section 250-74, Exception No. 4, and for the implementation of other technical power systems in compliance with Article 250. For separately derived systems with 60 volts to ground, the branch-circuit equipment grounding conductor shall be terminated as required in Section 530-72 (b).

(FPN): See Section 410-56(c) for grounding type receptacles and required identification.

640-8. Grouping of Conductors.

Insulated conductors of different systems grouped or bundled so as to be in close physical contact with each other in the same raceway or other enclosure, or in portable cords or cables, shall comply with Section 300-3(c)(1).

640-9 Wiring Methods.

(a) Wiring to and Between Audio Equipment.

(1) Wiring and equipment from source of power to and between devices connected to the premises wiring systems shall comply with the requirements of Chapters 1 through 4, except as modified by this article.

(2) Separately derived systems shall comply with the applicable articles of this *Code* except as modified by this article. Separately Derived Systems With 60 Volts to Ground shall be permitted for use in audio system installations as specified in Article 530, Part G.

(3) All wiring not connected to the premises wiring system or to a wiring system separately derived from the premises wiring system shall comply with Article 725

(b) Auxiliary Power Supply Wiring. Equipment that has a separate input for an auxiliary power supply shall be wired in compliance with Article 725. Battery installation shall be in accordance with Article 480.

(FPN No. 1): This section does not apply to the use of UPS equipment, or other sources of supply which are intended to act as a direct replacement for the primary circuit power source and are connected to the primary circuit input.

(FPN No. 2): Refer to NFPA 72-1996, *National Fire Alarm Code*, where equipment is used for a fire alarm system.

(c) Amplifier Output Wiring. Amplifier output circuits carrying audio-program signals which do not exceed 120 volts under prescribed open-circuit test conditions shall be permitted to employ Class 2 or Class 3 wiring where listed for this use.

Exception: Listed amplifiers required to use Class 1 circuits as defined by Article 725.

(FPN No. 1): The requirement of 640-9(c) is based on amplifiers whose output voltage is 120 volts RMS or less when driven with a sinusoidal test signal of 100 Hz sufficient in amplitude to deliver maximum power into its rated load. Output voltage is determined after the load is removed.

It is well known that the RMS voltage of audio program material is typically 12dB lower (in voltage) than the amplifier's maximum potential output as determined above. This characteristic of audio program material is called crest factor. Thus, an amplifier which is 120 volts RMS or less under test conditions is capable of 170 volts peak output, which equates to an RMS voltage of 43 volts or less when reproducing program material. The term "dB" is a logarithmic method of expressing the ratio of the two values.

For reference: $-12\text{dB}_{\text{VOLTAGE}} = 1/4$ voltage.

(FPN No. 2): *Amplifiers for Fire Protective Signaling Systems*, ANSI/UL 1711-1994 contains requirements for the listing of amplifiers used for fire alarm systems in compliance with NFPA 72-1996 *National Fire Alarm Code*.

(FPN No. 3): Examples of requirements for listing amplifiers used in residential, commercial and professional use are found in *Commercial Audio Equipment*, ANSI/UL 813-1992, *Professional Video and Audio Equipment*, ANSI/UL 1419-1992, *Audio-Video Products and Accessories* ANSI/UL 1492-1992, or *Audio/Video and Musical Instrument Apparatus for Household, Commercial, and Similar Use*, ANSI/UL 6500-1996.

(d) Use of Audio Transformers and Autotransformers. Audio transformers and autotransformers shall only be used for audio signals in a manner so as not to exceed the manufacturer's stated input or output voltage, impedance, or power limitations. The input or output wires of an audio transformer or autotransformer shall be allowed to connect directly to the amplifier or loudspeaker terminals.

No electrical terminal or lead shall be required to be grounded or bonded.

640-10. Audio Systems Near Bodies of Water. Audio systems near bodies of water, either natural or artificial, shall be subject to the following restrictions.

Exception: This section does not include audio systems intended for use on boats, yachts, or other forms of land or water transportation used near bodies of water, whether or not supplied by branch circuit power.

(FPN): See Section 680-23 for installation of underwater audio equipment.

(a) Equipment Supplied by Branch Circuit Power. Audio system equipment supplied by branch circuit power shall not be placed laterally within 5 ft. (1.52 m) of the inside wall of a pool, spa, hot tub or fountain, nor within 5 ft. (1.52 m) of the prevailing or tidal high water mark. The equipment shall be provided with branch circuit power protected by a ground-fault circuit-interrupter where required by other Articles.

(b) Equipment Not Supplied by Branch Circuit Power. Audio system equipment powered by a listed Class 2 power supply or by the output of an amplifier listed as permitting the use of Class 2 wiring shall only be restricted in placement by the manufacturer's recommendations.

(FPN): Placement of the power supply or amplifier, if supplied by branch circuit power, is still subject to 640-10(a).

B. Permanent Audio System Installations

640-21. Use of Flexible Cords and Cables

(a) Between Equipment and Branch Circuit Power. Power supply cords for audio equipment shall be suitable for the use and shall be permitted to be used where the interchange, maintenance, or repair of such equipment is facilitated through the use of a power supply cord.

(b) Between Loudspeakers and Amplifiers, or Between Loudspeakers. Cables used to connect loudspeakers to each other or to an amplifier shall comply with Article 725. Other listed cable types and assemblies, including optional hybrid communications, signal, and optical fiber cables, shall be permitted.

(c) Between Equipment. Cables used for the distribution of audio signals between equipment shall comply with Article 725. Other listed cable types and assemblies, including optional hybrid communications, signal, and optical fiber cables, shall be permitted. Other cable types and assemblies specified by the equipment manufacturer as acceptable for the use shall be permitted in accordance with Section 110-3(b).

(d) Between Equipment and Power Supplies Other Than Branch Circuit Power

(1) Storage batteries shall be installed and wired in accordance with the requirements of this *Code* for the voltage and power delivered.

(2) Transformers, transformer-rectifiers, and other AC or DC power supplies shall be installed and wired in accordance with the requirements of this *Code* for the voltage and power delivered.

(FPN): For some equipment, sources such as in (1) and (2) will serve as the only source of power. These could, in turn, be supplied with intermittent or continuous branch circuit power.

(e) Between Equipment Racks and Premises Wiring System. Flexible cords and cables shall be permitted for the electrical connection of permanently installed equipment racks to the premises wiring system to facilitate access to equipment or for the purpose of isolating the technical ground of the rack from the premises ground. Connection shall be made using either approved plugs and receptacles or by direct connection within an approved enclosure. Flexible cords and cables shall not be subjected to physical manipulation or abuse while the rack is in use.

640-22. Wiring of Equipment Racks. Equipment racks shall be fabricated of metal and grounded. Bonding shall not be required if the rack is connected to a technical power ground.

Equipment racks shall be wired in a neat and workmanlike manner. Wires, cables, structural components, or other equipment shall not be placed in such a manner as to prevent reasonable access to equipment power switches and resettable or replaceable circuit overcurrent protection devices.

Supply cords or cables, if used, shall terminate within the equipment rack enclosure in an identified connector assembly. The supply cords or cable (and connector assembly, if used) shall have sufficient ampacity to carry the total load connected to the equipment rack and shall be protected by overcurrent devices.

640-23. Conduit or Tubing.

(a) Number of Conductors. The number of conductors permitted in a single conduit or tubing shall not exceed the percentage fill specified in Table 1, Chapter 9.

(b) Non-Metallic Conduit or Tubing, and Insulating Bushings. The use of non-metallic conduit or tubing, and insulating bushings shall be permitted where a technical ground system is employed and shall comply with applicable articles.

640-24. Wireways, Gutters, and Auxiliary Gutters. The use of metallic and non-metallic wireways, gutters, and auxiliary gutters shall be permitted for use with audio signal conductors and shall comply with applicable articles with respect to permitted locations, construction and fill.

640-25. Loudspeaker Installation in Fire Resistance Rated Partitions, Walls, and Ceilings. Loudspeakers installed in a fire resistance rated partition, wall or ceiling shall be listed for the purpose or installed in an enclosure or recess which maintains the fire resistance rating.

(FPN): Fire-rated construction is the fire-resistive classification used in building codes. One method of determining fire rating is testing in accordance with Standard Methods of Tests of Fire Endurance of Building Construction and Materials, NFPA 251-1995.

C. Portable and Temporary Audio System Installations.

640-41 Multipole Branch Circuit Cable Connectors. Multipole branch circuit cable connectors, male and female, for power supply cords and cables shall be constructed so that tension on the cord or cable will not be transmitted to the connections. The female half shall be attached to the load end of the power supply cord or cable. The connector shall be rated in amperes and designed so that differently rated devices cannot be connected together. AC multipole connectors shall be polarized and comply with Sections 410-56(f) and 410-58. AC or DC multipole connectors utilized for connection between loudspeakers and amplifiers, or between loudspeakers, shall not be compatible with non locking 15 or 20 ampere rated connectors intended for branch circuit power, nor with connectors rated 250 volts or greater of either the locking or non locking type. Signal cabling not intended for such loudspeaker and amplifier interconnection shall not be permitted to be compatible with multipole branch circuit cable connectors of any accepted configuration.

(FPN): See Section 400-10 for pull at terminals.

640-42 Use of Flexible Cords and Cables

(a) Between Equipment and Branch Circuit Power. Power supply cords for audio equipment shall be listed and shall be permitted to be used where the interchange, maintenance, or repair of such equipment is facilitated through the use of a power supply cord.

(b) Between Loudspeakers and Amplifiers, or Between Loudspeakers. Flexible cords and cables used to connect loudspeakers to each other or to an amplifier shall comply with Article 400 and Article 725, respectively. Cords and cables listed for portable use, either hard or extra hard usage as defined by Article 400, shall also be permitted. Other listed cable types and assemblies, including optional hybrid communications, signal, and optical fiber cables, shall be permitted.

(c) Between Equipment and/or Between Equipment Racks. Flexible cords and cables used for the distribution of audio signals between equipment shall comply with Article 400 and Article 725, respectively. Cords and cables listed for portable use, either hard or extra hard service as defined by Article 400, shall also be permitted. Other listed cable types and assemblies, including optional hybrid communications, signal, and optical fiber cables, shall be permitted.

(d) Between Equipment, Equipment Racks, and Power Supplies Other Than Branch Circuit Power

(1) Storage batteries shall be installed and wired in accordance with the requirements of this *Code* for the voltage and power delivered.

(2) Transformers, transformer-rectifiers, and other AC or DC power supplies shall be installed and wired in accordance with the requirements of this *Code* for the voltage and power delivered.

(3) Generators shall be installed in accordance with Article 445

(e) Between Equipment Racks and Branch Circuit Power. The supply to a portable equipment rack shall be by means of listed extra-hard usage cords or cables, as defined in Article 400. For outdoor portable or temporary use, the cords or cables shall be further listed as being suitable for wet locations and sunlight resistant.

(1) Where equipment racks include audio and lighting and/or power equipment, Articles 520 and 525 shall apply as appropriate.

(2) The usage and construction of cable extensions, adapters, and breakout assemblies shall be in accordance with Article 520 or 525 as appropriate.

640-43. Wiring of Equipment Racks.
Equipment racks fabricated of metal shall be grounded. Non-metallic racks with covers (if provided) removed shall not allow access to Class 1, Class 3, or primary circuit power without the removal of covers over terminals or the use of tools.
Equipment racks shall be wired in a neat and workmanlike manner. Wires, cables, structural components, or other equipment shall not be placed in such a manner as to prevent reasonable access to equipment power switches and resettable or replaceable circuit overcurrent protection devices.
Wiring which exits the equipment rack for connection to other equipment or to a power supply shall be relieved of strain or otherwise suitably terminated such that a pull on the flexible cord or cable shall not increase the risk of damage to the cable or connected equipment such as to cause an unreasonable risk of fire or electric shock.

640-44. Environmental Protection of Equipment. Temporary outdoor, unsheltered placement or use of portable equipment not listed for the purpose shall be permitted only where appropriate protection of such equipment from adverse weather conditions is provided to prevent risk of fire or electrical shock. Where the system is intended to remain operable during adverse weather, arrangements shall be made for maintaining operation and ventilation of heat dissipating equipment.

640-45. Protection of Wiring. Where accessible to the public, flexible cords and cables laid or run on the ground or on the floor shall be covered with approved non-conductive mats. Cables and mats shall be arranged so as not to present a tripping hazard.

640-46. Equipment Access. Equipment likely to present a risk of fire, electrical shock or physical injury to the public shall be protected by barriers or supervised by qualified personnel such as to prevent public access.

SUBMITTER: William Keezer, Bose Corp./Rep. Nat'l Systems Contractors Assn.
RECOMMENDATION: Add a new section:
640-11 Underwater Audio Equipment
All underwater audio equipment shall be identified for the purpose.
(a) Speakers. Each speaker shall be mounted in an approved metal forming shell, the front of which is enclosed by a captive metal screen, or equivalent, that is bonded to and secured to the forming shell by a positive locking device that ensures a low-resistance contact and requires a tool to open for installation or servicing of the speaker. The forming shell shall be installed in a recess in the wall or floor of the pool.
(b) Wiring Methods. Rigid metal conduit or intermediate metal conduit of brass or other identified corrosion-resistant metal or rigid nonmetallic conduit shall extend from the forming shell to a suitable junction box or other enclosure as provided in Section 680-21. Where rigid nonmetallic conduit is used, a No. 8 insulated copper conductor shall be installed in this conduit with provisions for terminating in the forming shell and the junction box. The termination of the No. 8 conductor in the forming shell shall be covered with, or encapsulated in, a suitable potting compound to protect such connection from the possible deteriorating effect of pool water.
(c) Forming Shell and Metal Screen. The forming shell and metal screen shall be of brass or other approved corrosion-resistant metal.
SUBSTANTIATION: CMP 20 correctly observed that many sections of proposal 16-6-(640) may have applicability in the vicinity of pools. Notwithstanding the claim that Article 680 has responsibility for audio equipment adjacent to pools, etc., it is clear that the entire contents of the proposed Article 640 should be replicated into Article 680 if CMP 20's suggestion that "The proposed revision of Article 640 dealing with audio equipment adjacent to pools etc. would be more appropriately contained in Article 680" is to be taken seriously. Conversely, Section 680-23 is the only place in Article 680 where audio equipment of ANY type is mentioned. It would appear to be more appropriate to place the contents of Section 680-23 within Article 640 where proposed.
Two examples of installation environments which could cause conflicting interpretations:
1) An outdoor area of a resort hotel. This area has a gazebo for amplified music and poetry readings. A natural brook flows through the area, and an ornamental fountain is also near the gazebo, the overflow from which is diverted into a second, imitation brook ending in a reflecting pool in which children wade to catch frogs. Loudspeakers are installed in the trees, on the grassy areas beside the walkways, and disguised as rocks and placed in rock formations at the sides of both brooks. When a concert takes place, an additional temporary sound system is installed consisting of loudspeakers on the stage and on tripods in the lawn area. Some are near the fountain, some near the natural brook, and some in the middle of the 3 acre site. Signal sources and amplification for the landscape system are in the hotel. It is a single amplifier circuit listed to permit the use of Class 2 wiring. The concert system is powered by a system located at the gazebo. No speakers of either system are IN a body of water, although many might be considered "adjacent". Where does 680 stop and 640 start? At what point do the speakers disguised to look like rocks fall under 680? What about the other speaker on the same circuit, 4 feet further away from the fountain but closer to the natural brook? Note the fundamental conflict between adjacency to natural bodies of water (ONLY addressed in the 16-6-(640) proposal) and artificial bodies of water (the claimed domain of Article 680), even though the issues of electrical safety are identical in both cases.
2) An upscale residence has all the audio goodies, including a background music system throughout the house and grounds, a pool, and a hot tub in a corner of the master bedroom. The background music system is on zones using multiple amplifiers under a master control. The entry hall foyer has a sculptured rock waterfall with one of the background music loudspeakers overhead, and spaced every 10 feet down the hall. In the master bedroom both the background music system and an independent, built-in A/V system which supports the bedroom TV are installed. A background music loudspeaker and the right rear A/V speaker are near the hot tub; one in the ceiling and one mounted on the wall. The pool area has background music speakers mounted in a patio roof which overhangs the pool. These speakers are on the same circuit as those in the garage and the loudspeakers hidden in the landscaping. A switch and a multitap audio auto-transformer are used to turn on and control the volume of the in-pool loudspeaker system. The entire system is a 70 volt "constant voltage" type using a single amplifier listed for use with Class 2 wiring.
As can be seen by these examples, the applicability of 680 is far from clear, yet in the absence of Article 680, Article 640 addresses every issue directly except for the mechanical aspects of underwater loudspeaker installation.
While very modestly expanding the content of Article 640, this proposal does nothing to expand its scope. This proposal also complies with the intent of the submitters of Article 640 in reducing confusion and the appearance of conflicting articles relating to the installation of audio systems.
This comment is a companion comment to a comment made in response to proposal 20-8-(680-3).
Since this comment involves the coordination of two Code Making Panels (16 and 20), it is respectfully suggested that the Technical Correlating Committee also review this comment and make a recommendation to either:
1) Accept or Accept in Principle proposal 20-81-(680-3) or
2) consider this and a companion Section 680-23 comment as a means of clarifying which Article best addresses the issues of audio system installation in general, as well as those adjacent to or in the vicinity of pools as defined in Article 680.
Note: Supporting material is available for review at NFPA Headquarters.
PANEL ACTION: Accept.

16- 12 - (640-21(d)): Accept
SUBMITTER: Melvin J. Wierenga, Wierenga & Assoc.
RECOMMENDATION: Revise Section 640-21(d) as follows:
(d) Between Equipment and Power Supplies Other Than Branch-Circuit Power. The following power supplies other than branch-circuit power supplies shall be installed and wired between equipment in accordance with the requirements of this Code for the voltage and power delivered:
(1) Storage batteries
(2) Transformers
(3) Transformer rectifiers
(4) Other ac or dc power supplies

FPN: For some equipment, these sources such as in (1) through (4) will serve as the only source of power. These could, in turn, be supplied with intermittent or continuous branch-circuit power.
SUBSTANTIATION: The new NEC Style Manual (April 1999), Section 2.1.5.1 provides that lists are a method of structuring the items necessary to complete a rule.
PANEL ACTION: Accept.

(Log #2182)

16- 13 - (640-21(e)): Accept
SUBMITTER: Roland L. Comeau, Intermountain Power Service Corp.
RECOMMENDATION: Revise as follows:
Flexible cords and cables shall be permitted for the electrical connection of permanently installed equipment racks to the premises wiring system to facilitate access to equipment or for the purpose of isolating the technical power system ~~ground~~ of the rack from the premises ground. Connection shall be made using either approved plugs and receptacles or by direct connection within an approved enclosure. Flexible cords and cables shall not be subjected to physical manipulation or abuse while the rack is in use.
SUBSTANTIATION: The term technical ground is undefined. The term technical power system is defined in 640-2 and this definition includes grounding of this system. Therefore, technical power system applies and should be used.
PANEL ACTION: Accept.

16- 14 - (640-22): Accept
SUBMITTER: John H. Schmidt, ABC TV
RECOMMENDATION: Revise text to read as follows:
"640-22. Wiring of Equipment Racks and Enclosures. Metal e~~E~~quipment racks and enclosures shall be ~~fabricated of metal and~~ grounded...".
SUBSTANTIATION: Audio equipment is often mounted in consoles or other enclosures, rather than racks. This is particularly true in the television and recording industries. Historically, these enclosures are often made of Formica covered wood or other nonconductive material. Even racks are sometimes nonmetallic; particularly where weight is a concern. When the rack or enclosure is metal, it should be grounded. To require all equipment to be installed in metal racks is unrealistic; to require fabrication of consoles from metal is prohibitively expensive and unnecessary.
The equipment that is typically mounted in these racks or enclosures is manufactured and listed for use without any external enclosure. The enclosure provided by the manufacturer with the equipment is safe and adequate for tabletop usage. There is no history of problems with nonmetallic enclosures. The requirement for metal racks, which first appeared as a part of the general revision of Article 640 in the last code revision cycle, should be removed.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 22
COMMENT ON AFFIRMATIVE:
BRUNSSEN: The submitter's reference to Section 640-21(d)(1), (2), in his recommendation is incorrect. The correct section is Section 640-42(d)(1), (2).

(Log #3662)

16- 17 - (640-42(d)(3)): Accept in Principle
SUBMITTER: Melvin J. Wierenga, Wierenga & Assoc.
RECOMMENDATION: Delete Section 640-2(d)(3).
SUBSTANTIATION: Problem: This section does not readily fit the use of either Section 2.1.5.1 List Formats, or 2.1.5.2, Subdivision Titles, of the revised 1999 NEC Style Manual.
Solution: This is a companion proposal to a proposal initiated by Mr. William Keezer for a new Section 640-3(l). Section 640-3 rightly provides a place to consolidate the information in Section 640-42(d)(3) and quickly provides guidance and direction to the end user. This change provides consistency of format as already provided for by Section 640-3(a) through (k).
PANEL ACTION: Accept in Principle.
Delete Section 640-42(d)(3).
PANEL STATEMENT: There is a typographical error in the recommendation. The change corrects this error.

AFFIRMATIVE: 22

(Log #3663)

16- 18 - (640-42(e)(1), (2)): Accept
Note: The Technical Correlating Committee directs the Panel to clarify the Action on this Proposal relative to the reference to "Section 400," specifically what section number is to be included. The Technical Correlating directs that the Action on this Proposal be revised to comply with the NEC Style Manual 4.1.1 regarding referencing an entire article. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Melvin J. Wierenga, Wierenga & Assoc.
RECOMMENDATION: Revise Section 640-42(e) as follows:
(e) Between Equipment Racks and Branch-Circuit Power. The supply to a portable equipment rack shall be by means of listed extra-hard usage cords or cables, as defined in Section 400. For outdoor portable or temporary use, the cords or cables shall be further listed as being suitable for wet locations and sunlight resistant. Articles 520 and/or 525 shall apply as appropriate when the following conditions exist:
(1) Where equipment racks include audio and lighting and/or power equipment.
(2) When using or constructing cable extensions, adapters, and breakout assemblies.

SUBSTANTIATION: The new NEC Style Manual (April 1999), Section 2.1.5.1 provides that lists are a method of structuring the items necessary to complete a rule.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 22

ARTICLE 645 — INFORMATION TECHNOLOGY EQUIPMENT

(Log #620)

12- 78 - (645-1): Reject

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: Bruce Fairweather, Electrical Safety Inc.
RECOMMENDATION: Fourth line, after the word units, replace the remaining sentence with "in information technology equipment rooms, and rooms containing semiconductor manufacturing and test areas."
SUBSTANTIATION: One only has to visit a major semiconductor manufacturing facility to see that much of the manufacturing and testing is accomplished in rooms with raised floors. The raised floors in these rooms are plenum areas dedicated to environmental air and meet the requirements of 645-2 a thru f. The inclusion of the term manufacturing and test will leave no room for doubt as to Article 645's scope of inclusion. Where manufacturing and testing is performed in non-raised floor areas that do not meet 645-2 a thru f the article would not apply.
PANEL ACTION: Reject.
PANEL STATEMENT: Scoping issues are under the jurisdiction of the TCC. The panel recommends the TCC does not expand the scope of Article 645 to include semiconductor manufacturing and test facilities.

NOT RETURNED: 2 Kelly, Laney

(Log #2532)

12- 79 - (645-1, FPN; 645-2):

Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee rejects the Panel Action. The Technical Correlating Committee rejects the Panel Action on that part of the proposal pertaining to Section 645-1 because the Fine Print Note contains a statement of intent and repeats information contained in 90-3. The remainder of the proposal pertaining to Sections 645-2(b), (c), and (e) continue to be accepted in accordance with the Panel Action.
SUBMITTER: Technical Committee on Electronic Computer Systems
RECOMMENDATION: 645-1: Revise the Fine Print Note to read: Because of particular operating and installation conditions required of equipment located within an information technology equipment room, often referred to as a "computer room", amendments to the requirements in Chapters 1-4 of the Code are necessary. The intent of this Article is to allow the use of the special equipment, grounding and wiring requirements described herein if all the conditions of Section 645-2 are met.
Equipment, grounding and wiring installed in information technology rooms not as described in Section 645-2 are subjected to Chapters 1-4 of the Code without these amendments. For further information, see Standard for the Protection of Electronic Computer/Data Processing Equipment, NFPA 75-1999, which provides occupancy requirements for both the information technology (computer) room and the more encompassing computer area.
645-2:
645-2(b) Revise the Fine Print Note to read: For further information, see Standard for the Protection of Electronic Computer/Data Processing Equipment, NFPA 75-1999, Chapter 8, Paragraphs 8-1, 8-1.1, 8-1.2, and 8-1.3.
645-2(c) Delete the Fine Print Note.
645-2(e) Add a Fine Print Note to read: For further information on room construction requirements, see Standard for the Protection of Electronic Computer/Data Processing Equipment, NFPA 75-1999, Chapter 3.
SUBSTANTIATION: 1. Need for correlation between NFPA 70 and NFPA 75 - Standards Council requirement.
2. Refer readers of NFPA 70 to the occupancy recommendations included in NFPA 75.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #33)

12- 80 - (645-2): Reject

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 12-79. See Technical Correlating Committee action on Proposal 12-79. This Proposal is a Comment that was Held for Further Study during the processing of the 1999 NEC. As such, the Technical Correlating Committee directs that the Panel act upon this Proposal based on its merits. This action will be considered by the Panel as a Public Comment.
NOTE: The following proposal consists of Comment 12-57 on Proposal 12-108 in the 1998 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 1999 NATIONAL ELECTRICAL CODE. The recommendation in Proposal 12-108 was:
This section is broken down into six subdivisions (1, 2, 3, 4, 5, and 6).
The proposed change is to relabel the six subdivisions as (a, b, c, d, e, and f).
SUBMITTER: Technical Committee on Electronic Computer Systems
RECOMMENDATION: Replace 645-2 with the following:
645-2. Special Requirements for Information Technology Equipment Room. This article applies, provided all the following conditions are met:
1.
(8-1) Heating, Ventilating, and Air Conditioning (HVAC). An air conditioning system shall be provided for the computer room/media storage room and shall comply with one of the following:
(a) An HVAC system that is dedicated for electronic computer/data processing equipment use and is separated from other areas of occupancy shall be used.
(b) Any HVAC system that serves other occupancies shall also be permitted to serve the computer room/media storage room. The air ducts shall be provided with automatic fire and smoke dampers.
(8-1.1) Dampers in HVAC systems serving computer rooms/media storage rooms shall operate upon activation of smoke detectors and by operation of the disconnecting means required by 8-4.7.
(8-1.2) Air ducts serving other rooms either shall not pass through the electronic equipment rooms, or fire dampers shall be provided in the ducts.
(8-1.3) All duct insulation and linings, including vapor barriers and coatings, shall be noncombustible.
(8-1.4*) Air filters for use in air conditioning systems shall be noncombustible and installed in accordance with manufacturer's instructions.
2.
(5-1) Computer Equipment.
(5-1.1) Equipment and replacement parts shall meet the requirements of UL 478, Standard for Electronic Data-Processing Units and Systems, or UL 1950, Standard for Safety of Information Technology Equipment Including Electrical Business Equipment.
(5-1.2) Listed equipment shall be considered as meeting the requirements of 5-1.3.

(5-1.3*) Each individual unit shall be constructed in such a way that by limiting combustible materials, or by use of enclosures, fire is not likely to spread beyond the unit where the source of ignition is located. Automatic protection shall be provided for all units not so constructed.
(5-1.4) Enclosures of floor-standing equipment having external surfaces of combustible materials of such size that might contribute to the spread of an external fire shall have a flame-spread rating of 50 or less. (See NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials.)
(5-1.4.1) Equipment conforming to the requirements of UL 478, Standard for Electronic Data-Processing Units and Systems, or UL 1950, Standard for Safety of Information Technology Equipment Including Electrical Business Equipment, shall be considered as meeting the requirement of 5-1.4.
(5-2) Construction Features.
(5-2.1*) Cables. Interconnecting cables and wiring between units, power cords, plugs, and connectors shall be listed. They shall be considered as part of the computer system and suitable for installation on the floor or under a raised floor as described in Section 3-4.
(5-2.2) Cords. Approved flexible cord and plug assemblies used for connecting computer equipment to the branch circuit to facilitate interchange shall not exceed 15 ft (4.57m) in length.
(5-2.3) Filters. Air filters for use in the cooling systems of individual units shall be listed. They shall be arranged in such a way that they can be readily removed, inspected, cleaned, or replaced when necessary.

(5-2.4) Liquids. If the design of the unit is such that oil or equivalent liquid is required for lubrication, cooling, or hydraulic purposes, it shall have a closed-cup flash point of 300°F (149°C) or higher, and the container shall be of a sealed construction, incorporating automatic pressure relief devices.
(5-2.5) Acoustical Materials. All sound-deadening material used inside of computer equipment shall be of such material, or so arranged, that it does not increase the potential of fire damage to the unit or the potential of fire propagation from the unit.
3.
(3-1*) Building Construction.
(3-1.1) The computer area shall be housed in one of the following:
(a) A building constructed in accordance with NFPA 220, Standard on Types of Building Construction, Type I (443) or (332), or Type II (222) or (111).
(b) A single story building constructed in accordance with NFPA 220, Standard on Types of Building Construction, Type II (000).
Exception: A computer area that is housed in a fully sprinklered building in accordance with NFPA 13, Standard for the Installation of Sprinkler Systems.
(3-1.2*) Protection for the building housing the computer area shall be provided where it is subject to damage from external exposure.
(3-1.3*) The computer area shall be separated from other occupancies within the building (including atria or other open-space construction) by fire-resistant rated construction. The computer room shall be separated from other occupancies in the computer area by fire-resistant rated construction. The fire resistance rating shall be commensurate with the exposure but not less than one hour for both. (See Appendix B.)
(3-1.3.1) The fire-resistant rated enclosures shall extend from the structural floor to the structural floor above or to the roof.
(3-2*) Location of Computer Area within the Building.
(3-2.1*) The computer area shall not be located above, below, or adjacent to areas or other structures where hazardous processes are located unless adequate protective features are provided.
(3-3) Computer Area Interior Construction Materials.
(3-3.1) All interior wall and ceiling finishes in the computer area shall have a Class A rating. (See NFPA 101®, Life Safety Code®.)
Exception: Interior wall and ceiling finishes in fully sprinklered computer areas shall be permitted to be Class B.
(3-3.1.1) Interior floor finishes used in computer areas shall be Class I. (See NFPA 101, Life Safety Code.)
Exception: Interior floor finishes in fully sprinklered computer areas shall be permitted to be Class II.
(3-3.1.2) Exposed cellular plastics shall not be used in computer area construction.
Exception: Plastics within a fire-rated assembly are permitted.
(3-3.2*) A structural floor where a computer system is located, or that supports a raised floor installation, shall incorporate provisions for drainage from domestic water leakage, sprinkler operation, coolant leakage, or fire-fighting operations.
(3-4*) Raised Floors.
(3-4.1) Structural supporting members for raised floors shall be of noncombustible material.
(3-4.2) Decking for raised floors shall be noncombustible.
Exception No. 1: Pressure-impregnated, fire-retardant treated lumber having a flame-spread rating of 25 or less shall be permitted. (See NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials.)
Exception No. 2: Wood or similar core material that is encased on the top and bottom with sheet, cast, or extruded metal, with all openings or cut edges covered with metal or plastic clips or grommets so that none of the core is exposed, and that has an assembly flame-spread rating of 25 or less shall be permitted. (See NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials.)
(3-4.3) Access sections or panels shall be provided in raised floors so that all the space beneath is accessible.
(3-4.3.1) Tools needed to provide access to the underfloor space shall be located in the room and their location shall be well marked.
(3-4.4*) Electric cable openings in floors shall be made smooth or shall be otherwise protected to preclude the possibility of damage to the cables.
(3-5) Cable Openings and Other Penetrations.
(3-5.1) Cable openings or other penetrations through required fire-rated assemblies shall be fire stopped with a properly installed listed fire-stopping material that has a fire resistance rating equal to the fire resistance rating of the penetrated barrier when tested with a minimum positive furnace pressure differential of 0.01 in. of water (2.5 Pa) under ASTM E814, Standard Method of Fire Tests of Through-Penetration Fire Stops.
(3-5.2) Where any openings (e.g., pass-throughs or windows) are installed in any fire-rated wall of a computer area, each opening shall be equipped with an automatic fire-rated shutter. The shutter shall be operated automatically by the presence of either smoke or fire on either side of the wall.
Exception: Fire-rated windows of equal rating to the wall shall be permitted.
(3-6) Air Space. Where the air space below a raised floor or above a suspended ceiling is used to recirculate computer room/computer area environmental air, the wiring shall conform to Article 645 of NFPA 70, National Electrical Code®.
SUBSTANTIATION: There is a need for correlation between NFPA 70 and 75 as outlined in the Standards Council Guideline on Potential Jurisdictional (scope) Issues Between Committees Developing Occupancy Standards and Committees Developing Installation Standards. The material may have to be renumbered to suit the NEC format. This material is to be identified as extracted text from NFPA 75, 1995 edition.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel action on Proposal 12-79 supersedes this proposal.

NOT RETURNED: 2 Kelly, Laney

(Log #621)

12- 81 - (645-2): Reject
SUBMITTER: Bruce Fairweather, Electrical Safety Inc.
RECOMMENDATION: Second line. After "Equipment" add an "s," to Room and add "and rooms containing semi-conductor manufacturing and test areas."
SUBSTANTIATION: This modification to 645-2 should make the changes to the scope of 645-1 more cohesive. Because listed information technology equipment computer terminals are part and parcel with semiconductor manufacturing equipment changes to the wording of 645-2 (c) & (d) are not required.
PANEL ACTION: Reject.
PANEL STATEMENT: Semiconductor manufacturing and test areas are not within the scope of Article 645.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #3329)

12- 82 - (645-2(a)): Reject
SUBMITTER: Roger Witt, State Farm Ins. Co./Rep. State Farm Mutual Auto Insurance
RECOMMENDATION: Delete entire paragraph 645-2(a)
~~(a) Disconnecting means complying with Section 645-10 are provided.~~
SUBSTANTIATION: The disconnecting means requirement presents a problem with accidental or malicious activation and in some cases presents problems to equipment and processes external to the data room. Accidental or malicious shutdown of a data center causes a large economic hardship on businesses that rely heavily on data processing centers. The two issues addresed by the "disconnecting means" the shutdown of the electrical source and air supply to the room are addressed in other parts of the NEC and NFPA. Identification of power source locations are covered in NEC Sections 230-2(e) and 700-8. With this knowledge, the power source can be located and disconnected. With smoke detectors installed on the ceiling of the data room, under the raised floor, and in air handling systems of 2000 cfm or more (NFPA 90-4), the shut down of the air handling system is addressed. Also, requirements for using cable types meeting flame test under the raised floor by either the NFPA or model building codes help in reducing the propagation of fire and smoke. In some data rooms automatic fire sprinklers are required adding yet another means to help reduce the destructive affects of a fire. With the power source locations identified and the installation of smoke detectors, fan shutdown systems upon the sensing of smoke, fire sprinklers, and flame spread rated cables, it seems that protection is provided without the need for a single switch that will turn off the power to the entire data room.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel is sensitive to the issue of economic hardship, however, no definitive technical substantiation has been submitted to document problems in this area. The requirements for the installation of a disconnecting means in accordance with 645-10 is a necessary requirement consistent with the purpose of the NEC.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney
COMMENT ON AFFIRMATIVE:
JONES: I asked for input from the members of NFPA 75 and received ten responses. All ten were in favor of having a disconnecting means; however, no one could document an instance when it was used in an actual emergency. Several committee members could remember accidental activation of the disconnecting means. Neither the NEC nor NFPA 75 prohibits the use of shields or other means to prevent accidental activation. Hopefully, NFPA 75 will discuss the need for this disconnecting means and give guidelines for its installations.

(Log #3328)

12- 83 - (645-2(b)): Reject
SUBMITTER: Roger Witt, State Farm Ins. Co./Rep. State Farm Mutual Auto Insurance
RECOMMENDATION: Delete the text identified as "and also by operation of the disconnecting means required by Section 645-10."
645-2(b) A separate heating/ventilaing/air-conditioning (HVAC) system is provided that is dedicated for information technology equipment use and is separated from other areas of occupancy. Any HVAC system that serves other occupancies shall be permitted to also serve the information technology equipment room if fire/smoke dampers are provided at the point of penetration of the room boundary. Such dampers shall operate on activation of smoke detectors. ~~and also by operation of the disconnecting means required by Section 645-10.~~
SUBSTANTIATION: The disconnecting means requirement presents a problem with accidental or malicious activation and in some cases presents problems to equipment and processes external to the data room. Accidental or malicious shutdown of a data center causes a large economic hardship on businesses that rely heavily on data processing centers. The two issues addresed by the "disconnecting means" the shutdown of the electrical source and air supply to the room are addressed in other parts of the NEC and NFPA. Identification of power source locations are covered in NEC Sections 230-2(e) and 700-8. With this knowledge, the power source can be located and disconnected. With smoke detectors installed on the ceiling of the data room, under the raised floor, and in air handling systems of 2000 cfm or more (NFPA 90-4), the shut down of the air handling system is addressed. Also, requirements for using cable types meeting flame test under the raised floor by either the NFPA or model building codes help in reducing the propagation of fire and smoke. In some data rooms automatic fire sprinklers are required adding yet another means to help reduce the destructive affects of a fire. With the power source locations identified and the installation of smoke detectors, fan shutdown systems upon the sensing of smoke, fire sprinklers, and flame spread rated cables, it seems that protection is provided without the need for a single switch that will turn off the power to the entire data room.

(Log #601)

12- 93 - (645-5(d)): Reject
SUBMITTER: Rick Zupan, Lake Oswego, OR
RECOMMENDATION: Revise 645-5(d) to read as follows:
(d) Under Raised Floors. Power cables, communication cables, connecting cables, and receptacles associated with the information technology equipment shall be permitted <u>to be run through and</u> under a raised floor, provided the following.
SUBSTANTIATION: It is necessary to recognize that in order to run a cord under a raised floor it is necessary to run it through the floor despite Section 400-8(2).
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concerns are addressed in 645-5(d)(4).
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Kelly, Laney
EXPLANATION OF NEGATIVE:
POCH: I disagree with the panel in rejecting this proposal because I think its changed wording clarifies the intention of Proposal 12-93, helping to eliminate differences among Authorities Having Jurisdiction in their interpretation. Also Section 645-5(d)(4) is more concerned with abrasions to cables and debris on the subfloor.

(Log #2121)

12- 94 - (645-5(d)(1), FPN): Accept
SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.
RECOMMENDATION: Delete FPN reference to NFPA 75 after 645-5(d)(1).
SUBSTANTIATION: NFPA 75 standard is referenced after Section 645-1, Scope; is applicable to the whole Article; and does not need to be referenced again.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #599)

12- 95 - (645-5(d)(2)): Reject
SUBMITTER: Rick Zupan, Lake Oswego, OR
RECOMMENDATION: Revise 645-5(d)(2) to read as follows:
(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, metal wireway, surface metal raceway with metal cover, ~~flexible metal conduit, liquidtight flexible metal or nonmetallic conduit type MI cable, type MC cable, or type AC cable.~~ These supply conductors shall be installed in accordance with the requirements of Section 300-11.
SUBSTANTIATION: There is an apparent conflict between this section and Section 645-5(e). This change and the accompanying change should resolve this and recognize existing practice of running liquidtight flexible conduit unsecured under the floor.
PANEL ACTION: Reject.

PANEL STATEMENT: Liquidtight flexible conduit cannot be installed unsecured unless it is a part of or for listed information technology equipment (645-5(e)). The substantiation submitted is incomplete as it refers only to liquidtight flexible conduit and offers no definitive technical documentation for the proposed change. The submitter provides no substantiation documenting a problem with the current language.

(Log #2522)

12- 96 - (645-5(d)(2)): Accept
Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the actions on Proposals 12-97, 12-98, and 12-99. This action will be considered by the Panel as a Public Comment.
SUBMITTER: Lorena Orbanic, Carlon, Lamson & Sessions
RECOMMENDATION: Revise as follows:
(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, electrical nonmetallic tubing, metal wireway, surface metal raceway with metal cover, flexible metal conduit, liquid-tight flexible metal or nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of Section 300-11.
SUBSTANTIATION: Electrical Nonmetallic Tubing can be used in most places where Electrical Metallic Tubing can be used with a few exceptions. Thus, if EMT can be used in this application, ENT should also be able to be used in this application. Also, under the floor is not an area subject to physical damage, thus there shouldn't be a concern for that type of mechanical protection. In addition, ENT is subject to the provisions of Article 300-11 just as EMT is. Furthermore, Under Raised Floor is not considered a plenum area as defined by definitions in Article 100 and per 645-5(d)(3), and 300-22, thus it would not exclude ENT.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 11
NEGATIVE: 1
NOT RETURNED: 2 Kelly, Laney
EXPLANATION OF NEGATIVE:
POCH: Introducing nonmetallic tubing means introducing more combustible material, or material that could give off more fumes or smoke. Therefore, I disagree with the panel's action to accept this proposal.

(Log #2565)

12- 97 - (645-5(d)(2)): Accept
SUBMITTER: Lorena Orbanic, Carlon, Lamson & Sessions
RECOMMENDATION: Revise as follows:
(2) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing, metal wireway, surface metal raceway with metal cover, nonmetallic surface raceway, flexible metal conduit, liquidtight flexible metal or nonmetallic conduit, Type MI cable, Type MC cable, or Type AC cable. These supply conductors shall be installed in accordance with the requirements of Section 300-11.
SUBSTANTIATION: With respect to nonmetallic surface raceway, it serves the same purpose as surface metal raceway. Thus nonmetallic surface raceway should also be permitted to be used in this situation. In addition, under the floor is not an area subject to physical damage, thus there shouldn't be a concern for that type of mechanical protection. Furthermore, under raised floor is not considered a plenum area as defined by definitions in Article 100, per 300-22, and per 645-5(d)(3), so this should eliminate any concerns of relation to this.
PANEL ACTION: Accept.

(Log #4254)

12- 100 - (645-5(d)(3)): Accept in Principle
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Revise by adding the following sentence at the end:
The ventilation system shall be so arranged, with approved smoke detection devices, that upon the sensation of fire or products of combustion in the underfloor space the circulation of air will cease.

SUBSTANTIATION: Cables that will meet the required smoke resistance characteristics of the building codes for plenum areas, under presently available technology, do not all have acceptable electrical characteristics for these areas. Another approach is to provide a mechanism to sense and stop the circulation of air upon the sensation of smoke. This approach utilizes easily available devices interconnected with the drop-out relaying already in place under these floors.

The model building codes continue to classify these spaces as plenums. However, responsible officials in these organizations recognize the electrical problems involved. In general, the model building codes, including BOCA, will drop the plenum classification upon a showing that under fire conditions the spaces will no longer act as plenums, i.e., the circulation of air will stop.

In Massachusetts this approach has ended the conflict with the building code, which also changed with a correlating amendment. We used to have building inspectors failing jobs that electrical inspectors had passed, and both inspectors were correct. This approach has ended that problem.

In the prior code cycle, CMP 12 said that we hadn't identified a technical problem with the present code. If the building codes condemn the wiring under a computer floor as improper for an air-handling space, you can't operate the equipment. That sounds like a major technical difficulty to me. The point is to meet them half way. The way do do this is to assure that the floor won't actually be air handling during a fire condition. We can live with this, and we've eliminated the problem of confounding inspections by different disciplines.

PANEL ACTION: Accept in Principle.

Accept the proposal as modified by replacing the term "sensation" with "detection".

PANEL STATEMENT: The proposal is modified for consistency with terminology used in NFPA 72, National Fire Alarm Code.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

NOT RETURNED: 2 Kelly, Laney

(Log #598)

12- 101 - (645-5(d)(5)): Reject

SUBMITTER: Rick Zupan, Lake Oswego, OR

RECOMMENDATION: Revise as follows:

645-5(d)(5) Cable, other than those covered in (b) and (2) and those complying with (a), (b) and (c) below, shall be listed as type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room.

SUBSTANTIATION: The local authority having jurisdiction has decided that barring explicit language allowing it flexible cords cannot be used to plug into underfloor receptacles, this should correct this.

PANEL ACTION: Reject.

PANEL STATEMENT: Requirements for the use of listed DP cable were put into the NEC because of the panel's concerns that cables under the raised floor should pass the vertical flame test. Permitting other than DP cables would not fall within the purpose of the Code as outlined in 90-1. The Code already contains explicit language prohibiting the use of other than DP-type cable.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 10

NEGATIVE: 2

NOT RETURNED: 2 Kelly, Laney

EXPLANATION OF NEGATIVE:

BURKE: The panel should consider that the submitter was attempting to address an inconsistency between the technical content of the present code and the actual application of the code in the field. Although a technical reading of the present code does not permit flexible cords to be routed from the ITE situated above the raised floor to receptacles mounted under the floor, this installation practice is common in many ITE (computer) rooms. The practice is common in part because equipment in an ITE room sometimes must be relocated, and flexible cord better allows for this. Furthermore, due to trip hazards and similar concerns, it often is impractical to locate receptacles above the raised floor. Also, modern servers and similar ITE more commonly are designed to be installed in either a computer room or an office/business environment. Since much of this ITE connects to 15/125V, 20A/125V or 30A/125V branch circuits, it is cost prohibitive to design for, and often impractical to require two different wiring methods for the same equipment depending on the application, i.e., flexible cord if used in a non-ITE room application and some other Article 645 compatible wiring method for ITE room applications. When considering both the total volume of the underfloor area of an ITE room and the other protective features required of ITE rooms by both NEC Article 645 and NFPA 75, the presence of limited amounts of flexible cord under the raised floor would seem to have a minimal impact.

POCH: I disagree with the panel action to reject this proposal, because the proposal would have eliminated the problem of some Authorities Having Jurisdiction not allowing power cords to be plugged into underfloor receptacles. I think the panel statement that only DP cables, but not flexible cords, are permitted under raised floors, is historically incorrect for the following reasons:

1. The allowance of receptacles beneath raised floors, Section 645-5(d)(2), prior to the development of DP cables, had always implied flexible cords would be permitted below raised floors in order to plug into those receptacles.
2. DP cables have not been intended for use as power cords. They were introduced recently to the code and ITE standards for use as interconnecting cables.
3. Type DP cables are not present in Article 400, are not hard service cord types, and, therefore, would not be usable for power cords on machines outside computer rooms. Manufacturers would have to either market two machine types or replace cords in the field. Field rewiring is significantly less safe and dependable than that done and tested in manufacturing facilities.
4. During the introduction of DP cables, it was never mentioned that DP cables are required to replace flexible power cords. Prohibiting using these flexible power cords, if desired by this panel, should be the topic of a new proposal with full consideration of its impact on current installations and the timetable for implementation.
5. No current products or installations use DP cables for power cords since such construction is not allowed by UL 1950 (which only permits the following types for mounted floor equipment: SJ, SJE, SJO, SJOO, SJT, SJTO, SVTOO, S, SE, SO, SOO, ST, STO, AND STOO).
6. The interpretation that only DP cables could be used for power cordage below raised floors would result in placement of receptacles and power cords on the raised floor, resulting in possible increases in tripping hazards and damage risks to the cords.
7. Rejecting this proposal with the publication of the current panel statement would have the result of a change to the code and current usage.
8. Standard power cords run below raised floors constitutes almost 100 percent of current usage, and has not been shown to be a problem.

Therefore, I recommend accepting Proposal 12-101 as a correction or improvement in the current code.

COMMENT ON AFFIRMATIVE:

WHITE: The panel statement read that only DP cables are allowed under the raised floor. It should also refer to Section 645-5(d)(5)(c) which allows for types: TC, CL2, CL3, PLTC, NPLF, FPL, OFC, OFN, CM, MP, CATV. These designations shall be permitted to have an additional letter P or R or G. Green insulated single conductor cables, No. 4 and larger, marked "for use in cable trays" or "for CT use" shall be permitted for equipment grounding.

(Log #570)

12- 102 - (645-5(d)(5), FPN): Accept

SUBMITTER: Technical Correlating Committee National Electrical Code

RECOMMENDATION: Replace "4 ft. 11 in. (1.5 m)" with "1.5 m (4 ft. 11 in.)".

SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.

PANEL ACTION: Accept.

12- 105 - (645-5(d)(5)(c)): Reject

Note: It was the action of the Technical Correlating Committee that further consideration be given to the comments expressed in the voting. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Kari Barrett, Chemical Manufacturers Assn.

RECOMMENDATION: Add cable type designation ITC (Article 727) to the first sentence.

SUBSTANTIATION: Cable type ITC was added to the 1996 NEC and inadvertently left out here. ITC cable is being used in these areas as a safe application. Construction of ITC and PLTC is similar as to their characteristics which are applicable to this application.

PANEL ACTION: Reject.

PANEL STATEMENT: The submitter has not provided any technical substantiation that verifies this cable is acceptable for this use. The panel requires further information to be able to properly evaluate this product for this use.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 2 Kelly, Laney

EXPLANATION OF NEGATIVE:

WHITE: The panel statement asks for additional information about ITC cable. ITC cable, per Section 727-6, shall be insulated conductors in sizes No. 22 through 12. The conductor material shall be copper or thermocouple alloy. Insulation on the conductor shall be rated 300 volts. Shielding shall be permitted. The cable shall be listed as being resistant to the spread of fire. The outer jacket shall be sun light and moisture resistant. Where a smooth metallic sheath, continuous corrugated metallic sheath, or interlocking tape armour is applied over the nonmetallic sheath, an overall nonmetallic jacket shall be permitted to be applied, but not required.

In Section 727-4, under "Uses Permitted" No. 7 states: "ITC cable is permitted under raised floors in control rooms and rack rooms where arranged to prevent damage to the cable."

Code-Making Panel 16 accepted Proposal 16-102 to allow ITC cable under raised floors in information technology rooms' equipment rooms in accordance with Section 645-5(d)(5)(c).

(Log #4135)

12- 106 - (645-5(d)(6) (New)): Accept in Principle

Note: It was the action of the Technical Correlating Committee that this Proposal be reconsidered and correlated with the action on Proposal 16-80. This action will be considered by the Panel as a Public Comment.

SUBMITTER: Marcelo M. Hirschler, GBH Int'l, Inc./Rep. Plenum Cable Assn.

RECOMMENDATION: Revise as follows:

645-5. Supply Circuits and Interconnecting Cables.

(d) Under raised floors. Power cables, communications cables, connecting cables, interconnecting cables, and receptacles associated with the information technology equipment shall be permitted under a raised floor, provided the following:

(6) Abandoned cables, not intended for future use, shall not be permitted to remain.

SUBSTANTIATION: There is a significant amount of information indicating that the amount of cables installed in plenums, and other air-handling spaces, is increasing rapidly. An understanding of cabling practices indicates that the most common way in which cable installation is carried out is by disconnecting existing cable and leaving it abandoned in place, while introducing the cable needed to perform the additional functions. This creates an increased fuel load in plenums and other air-handling spaces, which is best controlled. There is, as yet, no indication that the additional cable in plenums causes an added fire hazard, and the fire record of cables in concealed spaces, both above ceilings and below floors, remain excellent. In fact, plenum cables, which meet the fire test requirements of NFPA 262, have been shown to have extremely good fire performance and to spread flame only very slowly, if at all. However, this type of preventive measure is worthwhile.

PANEL ACTION: Accept in Part.

Accept the proposal as modified by deleting: "not intended for future use," so the statement reads:

(6) Abandoned cables shall not be permitted to remain.

PANEL STATEMENT: The phrase "not intended for future use" is not enforceable. Such a statement defeats the purpose of the requirement.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 11

NEGATIVE: 1

NOT RETURNED: 2 Kelly, Laney

EXPLANATION OF NEGATIVE:

WHITE: I am voting negative on the panel action to "Accept in Part". The proposal should be accepted. Code-Making Panel 16 is recommending in Proposal 16-80 that the term "Abandoned Cable" be defined as follows: "Cable that is neither terminated at both ends, at a connector, or other equipment, nor identified for future use with a tag." This defines what abandoned cable is for the Authority Having Jurisdiction, and also allows for users to have adequate spare capacity that could be utilized in emergencies and for future expansion.

(Log #600)

12- 107 - (645-5(e)): Reject

SUBMITTER: Rick Zupan, Lake Oswego, OR

RECOMMENDATION: Revise 645-5(e) read as follows::

(e) Securing in Place. Power cables, flexible metal conduit, liquidtight flexible metal or nonmetallic conduit, type MI cable, type MC cable, type AC cable, communications cables, connecting cables, interconnecting cables and associated boxes, connectors, plugs and receptacles that are listed as part of or for, information technology equipment shall not be required to be secured in place.

SUBSTANTIATION: There is an apparent conflict between this section and Section 645-5(d)(2). This change and the accompanying change to 645-5(d)(2) should resolve this.

PANEL ACTION: Reject.

PANEL STATEMENT: There is no conflict between the two sections. 645-5(e) pertains to listed equipment. 645-5(d)(2) is for field-wired equipment.

NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14

VOTE ON PANEL ACTION:

AFFIRMATIVE: 12

(Log #3331)

12- 108 - (645-10): Reject
SUBMITTER: Roger Witt, State Farm Ins. Co./Rep. State Farm Mutual Auto Insurance
RECOMMENDATION: Delete Section 645-10 in its entirety.
SUBSTANTIATION: The disconnecting means requirement presents a problem with accidental or malicious activation and in some cases presents problems to equipment and processes external to the data room. Accidental or malicious shutdown of a data center causes a large economic hardship on businesses that rely heavily on data processing centers. The two issues addresed by the "disconnecting means" the shutdown of the electrical source and air supply to the room are addressed in other parts of the NEC and NFPA. Identification of power source locations are covered in NEC Sections 230-2(e) and 700-8. With this knowledge, the power source can be located and disconnected. With smoke detectors installed on the ceiling of the data room, under the raised floor, and in air handling systems of 2000 cfm or more (NFPA 90-4), the shut down of the air handling system is addressed. Also, requirements for using cable types meeting flame test under the raised floor by either the NFPA or model building codes help in reducing the propagation of fire and smoke. In some data rooms automatic fire sprinklers are required adding yet another means to help reduce the destructive affects of a fire. With the power source locations identified and the installation of smoke detectors, fan shutdown systems upon the sensing of smoke, fire sprinklers, and flame spread rated cables, it seems that protection is provided without the need for a single switch that will turn off the power to the entire data room.
PANEL ACTION: Reject.
PANEL STATEMENT: See the panel action on Proposals 12-82 and 12-83.

(Log #3377)

12- 109 - (645-10): Reject
SUBMITTER: Dale P. Missey, Mesa, AZ
RECOMMENDATION: Designate the existing paragraph as (a). Add a second paragraph, after the Exception as (b) Selective Coordination.
"The overcurrent protective devices in each disconnecting means shall be selectively coordinated with any other supply side overcurrent protective device."
SUBSTANTIATION: Continuity of service is critical for information technology rooms and equipment. This is evidenced by the use of UPS systems, standby generators, etc. These alternate sources of power are useless if a fault on one piece of equipment shuts down the entire system on the load side of the alternate source of power. This proposal will assure that information technology equipment will not be needlessly shut down due to a lack of selective coordination.
PANEL ACTION: Reject.
PANEL STATEMENT: The disconnecting means required by 645-10 does not require overcurrent protection.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:

(Log #4255)

12- 110 - (645-10): Accept
SUBMITTER: Frederic P. Hartwell, Hartwell Electrical Services, Inc./Rep. Massachusetts Electrical Code Advisory Committee
RECOMMENDATION: Insert the following sentence at the end of the paragraph.
Where a push button is used as a means to disconnect power, pushing the button in shall disconnect the power.
SUBSTANTIATION: This proposal imposes a very realistic rule grounded in the human expectation that a button is to be pushed in an emergency rather than pulled out. The substantiation is even more compelling based on the original submitter's actual field experience, which he unsuccessfully used in a public comment (#12-63) to CMP 12 in the prior code cycle. Furthermore, a pull-to-off E-Stop button implicitly violates Section 13.1.3 of NFPA 79 calling for mushroom head or extended operators on push buttons used for stop functions on industrial machinery. Although the literal text does not exclude a pull-to-off, the former chair of NFPA 79 (Dale Deming) assures me that the intent of that wording was to assure operability even if an operator's finger had been injured. In fact, Mr. Deming suggested that Massachusetts consider making something similar to this submittal as a proposal to the next edition of NFPA 79 so that no one ever attempts to finagle a pull-to-off button for something like this. Remember, there are lift covers that effectively preclude inadvertent operation.
There is, unfortunately, a long sorry history in the computer equipment business of evading national safety standards based on an attitude of "if we ship all the field wiring coiled in barrels, we can pretend the whole thing is an appliance." Several cycles back, this was done repeatedly in an attempt to avoid interconnections with the grounding electrode system in the building, under the mistaken assumption that the equipment wouldn't work if it were subject to pollution from other ground currents. It took a concerted effort by Bill Summers, Warren Lewis, Joe McPartland, this writer and many others to finally stop that. One of the ways we did it was by simply insisting that if it looked like field wiring after it was installed, it probably was indeed field wiring and as such had to comply with the separately derived system rules in the code.
This issue does not have the same significance, admittedly. However, I am perhaps uniquely sensitized to the idea that a manufacturer can ship a prewired Chapter 3 wiring method coiled in a barrel and then say that the installation provisions of the code don't apply; only the manufacturer's instructions apply. I don't think we can stand for that as a matter of policy. In fact, shifting a set of contacts on the device can be done by the field installer if need be. This proposal need not cause any manufactures any significant expense.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 14
VOTE ON PANEL ACTION:
AFFIRMATIVE: 10
NEGATIVE: 2
NOT RETURNED: 2 Kelly, Laney
EXPLANATION OF NEGATIVE:
JONES: This requirement should not be placed in this section. In my opinion this will add confusion and some authorities having jurisdiction will insist on push buttons without protective shields at these locations.
WHITE: There have been too many shutdowns of critical processes due to accidental contact with emergency push buttons that are pushed in to disconnect power. Computer systems now control very critical processes that when inadvertently shut down result in personnel injury and/or environmental releases. This is unacceptable.
A push to disconnect push button with a cover, as is suggested in the proposal, requires two hands to operate, whereas a pull to disconnect power button can still be operated with one hand.

(Log #CP1207)

12- 110a - (645-11): Accept
Note: The Technical Correlating Committee understands that this Proposal is modified by the action on Proposal 12-112.
SUBMITTER: CMP 12
RECOMMENDATION: Revise 645-11 to read as follows:
"645-11. Uninterruptible Power Supplies (UPS). Unless otherwise permitted in (a) or (b), UPS systems installed within the information technology room, and their supply and output circuits, shall comply with Section 645-10. The disconnecting means shall also disconnect the battery from its load.
(a) Installations qualifying under the provisions of Article 685.
(b) Power sources capable of supplying 750 volt-amperes or less derived either from UPS equipment or from battery circuits integral to electronic equipment, provided all other requirements of Section 645-11 are met."
SUBSTANTIATION: The proposal addressed NEC Style Manual issues .

"No. 14" to "14 AWG".
SUBSTANTIATION: To provide consistency throughout the Code. The term "No." is not used in any of the Tables in Chapter 3.
AWG and kcmil are trade size designators specifically authorized for use with the SI system of units in North America. Also, industry practice is to use AWG or kcmil only.
This is one of a series of proposals to make this change throughout the Code.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #2235)

16- 20 - (650-5(d)): Accept in Principle
SUBMITTER: Ravindra H. Ganatra, Alcan Cable
RECOMMENDATION: Change the phrase "flame-retardant" to "flame tested" and change "fireproof" to "listed."
SUBSTANTIATION: Specific requirements applicable for a given product's performance when subjected to the required flame test are addressed in the product standard applicable for that product. The NEC does not define "flame-retardant" (or "flame retardant") because the performance requirements vary by product. One may suggest that the present use of the term "flame-retardant" is not measurable and therefore implies a false sense of security. Use of the phrase "flame tested" informs the user that the product shall be tested against the requirements for a specific flame test and directs the user's attention to seek further understanding about the given product's performance.
[Note: The phrases "flame-retardant" (or "flame retardant") and "flame resistant" appear in 22 and 3 locations, respectively. This is a companion proposal to all other similar proposals. Also, see a general proposal for Article 110 that provides a basis to replace the phrases "flame-retardant" (or "flame retardant") and "flame resistant" by a phrase "flame tested" throughout the Code.]
A "listed" tape for the purpose could be evaluated for not only its capability to meet an applicable flame test requirement but other physical and electrical properties that may be necessary for this application.
PANEL ACTION: Accept in Principle.
Revise 650-5(d) to read as follows:
"(d) Cable Covering. Each cable shall be provided with an outer covering, either overall or on each of any subassemblies of grouped conductors. Tape shall be permitted in place of a covering. Where not installed in metal raceway, the covering shall be resistant to flame spread or the cable or each cable subassembly shall be covered with a closely wound listed fireproof tape.
FPN: One method of determining that cable is resistant to flame spread is by testing the cable to the VW-1 (vertical-wire) flame test in the Reference Standard for Electrical Wires, Cables and Flexible Cords, ANSI/UL 1581-1991."
PANEL STATEMENT: The panel has changed the term "flame retardant" to "resistant to flame spread" and added a FPN for explanation. This will correlate with Articles 725 and others. The term "listed" was added to insure that the tape used is listed for the purpose.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #981)

16- 21 - (650-7): Accept in Principle
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise to read as follows:
Overcurrent Protection. Circuits shall be so arranged that ~~all~~ No. 26 and No. 28 conductors shall be protected by an overcurrent device rated at not more than 6 amperes. Other conductor sizes shall be protected in accordance with their ampacity.
Exception: ~~The main supply conductors and the~~ A common return conductor shall not require overcurrent protection.
SUBSTANTIATION: Editorial. The syntax indicates all conductors shall be protected by one overcurrent device. Where larger than No. 26 or 28 conductors are used (Section 650-5(a)) other ratings should be permitted. The exception permits the proposed rule to apply to supply conductors and provides a complete sentence, while exempting a common return conductor.
PANEL ACTION: Accept in Principle.
Revise the submitter's recommendation to read as follows:
"Overcurrent Protection. Circuits shall be so arranged that No. 26 and No. 28 conductors shall be protected by an overcurrent device rated at not more than 6 amperes. Other conductor sizes shall be

protected in accordance with their ampacity. A common return conductor shall not require overcurrent protection."
PANEL STATEMENT: The exception has been included as part of the main text as requested in Proposal 16-22.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 21
VOTE ON PANEL ACTION:
AFFIRMATIVE: 21

(Log #2567)

16- 22 - (650-7, Exception): Accept in Principle
SUBMITTER: Stanley D. Kahn, Tri-City Electric Co., Inc.
RECOMMENDATION: Delete the exception.
Change the text to read as follows:
Circuits, other than those for the main supply conductors and the common return conductors, shall be arranged so that all conductors shall be protected from overcurrent by an overcurrent device rated at not more than 6 amperes.
SUBSTANTIATION: There are numerous exceptions in the NEC which can be expressed in positive code language. This proposal converts the exception into the section text without altering its intent.
PANEL ACTION: Accept in Principle.
PANEL STATEMENT: Refer to panel action on Proposal 16-21 which meets the intent of the submitter.

ARTICLE 665 — INDUCTION AND DIELECTRIC HEATING EQUIPMENT

(Log #1454)

12- 114 - (665): Accept
Note: The Technical Correlating Committee advises that Article Scope statements are the responsibility of the Technical Correlating Committee and the Technical Correlating Committee accepts the Panel Action.
SUBMITTER: John H. Mortimer, Inductotherm Industries, Inc.
RECOMMENDATION: Delete entire Article 665 "Induction and Dielectric Heating" and replace with new Article 665 as proposed:
Article 665 Induction and Dielectric Heating Equipment
A. General
665-1. Scope. This article covers the construction and installation of dielectric heating, induction heating, induction melting, induction welding equipment and accessories for industrial and scientific applications. Medical or dental applications, appliances, or line frequency pipeline and vessel heating are not covered in this article.
FPN See Article 427, Part E, for line frequency induction heating of pipelines and vessels.
665-2. Definitions.
Dielectric Heating. Dielectric heating is the heating of a nominally insulating material due to its own dielectric losses when the material is placed in a varying electric field.
Heating Equipment. The term heating equipment as used in this article includes any equipment used for heating purposes whose heat is generated by induction or dielectric methods.
Induction Heating, Melting and Welding. The heating, melting or welding of a nominally conductive material due to its own I^2R losses when the material is placed in a varying electromagnetic field.
Converting Device. The converting device is that part of the heating equipment that converts input mechanical or electrical energy to the voltage, current and frequency suitable for the heating applicator. A converting device shall consist of equipment using mains frequency, all static multipliers, oscillator-type units using vacuum tubes, inverters using solid state devices or motor generator equipment.
Heating Equipment Applicator. The heating equipment applicator is the device used to transfer energy between the output circuit and the object or mass to be heated.
665-3. Other Articles. Unless specifically amended by this article, wiring from the source of power to the heating equipment shall comply with Chapters 1 through 4.
665-4. Hazardous (Classified) Locations. Heating equipment shall not be installed in hazardous (classified) locations as defined in Article 500 unless the equipment and wiring are designed and approved for the hazardous (classified) locations.
665-5. Output Circuit. The output circuit shall include all output components external to the converting device, including contactors, switches, bus bars, and other conductors. The current flow from the output circuit to ground under operating and ground fault conditions shall be limited to a value which does not cause more than 50 volts to ground to appear on any accessible part of the heating equipment and its load. The output circuit shall be permitted to be isolated from ground.
665-7. Remote Control.
(a) Multiple Control Points. Where multiple control points are used for applicator energization, a means shall be provided and interlocked so that the applicator can be energized from only one control point at a time. A means for de-energizing the applicator shall be provided at each control point.
(b) Foot Switches. Switches operated by foot pressure shall be provided with a shield over the contact button to avoid accidental closing of a foot switch.
665-10. Ampacity of Supply Conductors. The ampacity of supply conductors shall be determined by (a) or (b).
(a) Nameplate Rating. The ampacity of conductors supplying one or more equipments shall not be less than the sum of the nameplate ratings for the largest group of machines capable of simultaneous operation, plus 100 percent of the standby currents of the remaining machines. Where standby currents are not given on the nameplate, the nameplate rating shall be used as the standby current.
(b) Motor Generator Equipment. The ampacity of supply conductors for motor generator equipment shall be determined in accordance with Article 430, Part B.
665-11. Overcurrent Protection. Overcurrent protection for the heating equipment shall be provided as specified in Article 240. This overcurrent protection shall be permitted to be provided separately or as a part of the equipment.
665-12. Disconnecting Means. A readily accessible disconnecting means shall be provided to disconnect each heating equipment from its supply circuit. The disconnecting means shall be located within sight from the controller or be capable of being locked in the open position. The rating of this disconnecting means shall not be less than the nameplate rating of the heating equipment. Motor-generator equipment shall comply with Article 430, Part J. The supply circuit disconnecting means shall be permitted to serve as the heating equipment disconnecting means where only one heating equipment is supplied.
B. Guarding, Grounding, and Labeling
665-19. Component Interconnection. The interconnection components required for a complete heating equipment installation shall be guarded.

665-20. Enclosures. The converting device (excluding the component interconnections) shall be completely contained within an enclosure(s) of non-combustible material.

665-21. Control Panels. All control panels shall be of dead-front construction.

665-22. Access to Internal Equipment. Access doors or detachable access panels shall be employed for internal access to heating equipment. Access doors to internal compartments containing equipment employing voltages from 150 volts to 1000 volts ac or dc shall be capable of being locked closed or shall be interlocked to prevent the supply circuit from being energized while the door(s) is open. Access doors to internal compartments containing equipment employing voltages exceeding 1000 volts ac or dc shall be provided with a disconnecting means equipped with mechanical lockouts to prevent access while the heating equipment is energized or the access doors shall be capable of being locked closed and interlocked to prevent the supply circuit from being energized while the door(s) is open. Detachable panels not normally used for access to such parts shall be fastened in a manner that will make them inconvenient to remove.

665-23. Warning Labels or Signs. Warning labels or signs that read "DANGER -- HIGH VOLTAGE -- KEEP OUT" shall be attached to the equipment and shall be plainly visible where persons might come in contact with energized parts, when doors are open or closed, or when panels are removed from compartments containing over 150 volts ac or dc.

665-24. Capacitors. The time and means of discharge shall be in accordance with Section 460-6 for capacitors rated 600 volts nominal and under. The time and means of discharge shall be in accordance with Section 460-28 for capacitors rated over 600 volts nominal. Capacitor internal pressure switches connected to a circuit-interruptor device shall be permitted for capacitor overcurrent protection.

665-25. Dielectric Heating Applicator Shielding. Protective cages or adequate shielding shall be used to guard dielectric heating applicators. Interlock switches shall be used on all hinged access doors, sliding panels or other easy means of access to the applicator. All interlock switches shall be connected in such a manner as to remove all power from the applicator when any one of the access doors or panels is open.

665-26. Grounding and Bonding. Grounding or inter-unit bonding, or both, shall be used wherever required for circuit operation, for limiting to a safe value radio frequency potentials between all exposed noncurrent-carrying parts of the equipment and earth ground, between all equipment parts and surrounding objects, and between such objects and earth ground. Such grounding and bonding shall be installed in accordance with Article 250 Parts B and E.

FPN: Under certain conditions contact between the object being heated and the applicator will result in an unsafe condition, such as eruption of heated materials. This unsafe condition may be prevented by grounding of the object being heated and ground detection.

665-27. Marking. Each heating equipment shall be provided with a nameplate giving the manufacturer's name and model identification and the following input data: line volts, frequency, number of phases, maximum current, full-load kilovolt-amperes (kVA), and full-load power factor. Additional data shall be permitted.

SUBSTANTIATION: The present Article 665 is outdated and in many areas obsolete. New technologies have not been addressed. In many instances, present requirements are vague and do not give a clear indication of procedures required for a safe installation.

The article was rewritten to conform to the style manual.

The addition of induction melting and induction welding processes are an important element of this proposal. These processes are widely used in today's technological industrial applications. Definitions have been added to widely enhance the installer's knowledge of induction and dielectric heating equipment. References to other articles in this code have been made more specific to assist users of the code in conforming to the requirements for installation and construction of these types of heating equipment. Motor-Generator converters will continue to be addressed to accommodate the use of older equipment still being used.

National Electric Code Panel 12 Chairman, Charles M. Trout, appointed John H. Mortimer, member of Panel 12, to form a Task Group to re-write and update this standard. The Task Group was widely based and consisted of many experts in their field in the design, manufacture and use of induction and dielectric heating equipment. This Task Group met on three separate occasions for two day meetings over a period of one year, apart from many correspondences and other communications. The members of the Task Group are shown in part 5.

SUMMARY OF SUBSTANTIATION

Article 665 Induction and Dielectric Heating Equipment

Added “Equipment” since this is for the equipment, not the heating process.

665-1. Scope. Added terms “dielectric heating,” “induction melting,” and “induction welding” for word searching.

Reworded for style.

665-2. Definitions. - Amended 3rd definition, added 4th and 5th definitions.

Added Melting and Welding for word searching and clarity.

Added Definition for clarity.

Added Definition for clarity.

665-3. Other Articles- Clarified text.

665-4. Hazardous (Classified) Locations. - Removed “induction and dielectric” because “Heating Equipment” per definition covers all heating equipment using induction or dielectric methods.

665-5. Output Circuit. -New Article. Combines intent of Articles 665-44(a) and 665-64(a) and makes it so testing can be accomplished.

665-7. Remote Control. -New Article - Combines 665-47 and 665-68 and clarified intent.

665-10. Ampacity of Supply Conductors. - New Article. Consolidates 665-41 and 665-61 into one part and clarified intent / removed redundancies.

665-11. Overcurrent Protection .- New Article. Consolidates 665-42 and 665-62 into one article.

665-12. Disconnecting Means. -New Article. Consolidates 665-43 and 665-63 into one article and clarified style.

665-19. Component Interconnection. - Consolidates 665-44(b) and 665-64(b)

665-20. Enclosures. Revised to clarify intent and style and made consistent with article 19. Articles 19 and 20 are all inclusive for all equipment in an installation

665-21. Control Panels. Revised (was “panel controls”) Clarifies intent as panel is dead front.

665-22. Access to Internal Equipment. - Revised wording for style and clarified intent. Change from 500 to 150 volts allows removal of 665-28. Reduces redundancies.

665-23. Warning Labels or Signs. Revised wording for style and clarified intent. Change from 500 to 150 volts allows removal of 665-28. Reduces redundancies.

665-24. Capacitors. Revised wording and added capacitors over 600 volts. This makes discharge conform to section 460 requirements. Pressure switch is new technology which greatly increases the safety of the equipment.

Explanation: A 5000 KVAR capacitor rated at 2500 volts will have a full load current of 2000 amperes. During a resistive failure of 100 ohms, between polarities, the resistive component of the current will be 25 amps. The I^2R losses are 62,500 watts. The total rms current is 2000.16 amps. No fuse or other overcurrent device can protect from case rupture (explosion) and still function at full load current.

665-25. Dielectric Heating Applicator Shielding. Rewritten specifically for dielectric heating. All induction systems are covered by 665-5 requirement of less than 50 volts under all conditions.

665-26. Grounding and Bonding. Added AParts B and E@

Added FPN for informational material.

665-27. Marking. Revised. Allows additional data such as standby currents on the data tag.

665-28. Delete - Covered by Change to 665-22.

665-40. Replaced by 665-2 - Included in definition for converting device.

665-41. Replaced by 665-10.

665-42. Replaced by 665-11.

665-43. Replaced by 665-12.

665-44. Replaced by 665-5 for (a) and 665-19 for (b).

665-47. Replaced by 665-7.

665-60. Replaced by 665-2.

665-61. Replaced by 665-10.

665-62. Replaced by 665-11.

665-63. Replaced by 665-12.

665-64. Replaced by 665-5 for (a) and 665-19 for (b)

665-66. Removed. Obsolete.

665-67. Replaced - Covered by 665-5.

665-68. Replaced by 665-.
Members of the Task Group were as follows:
Andrew Cartal; Raymond L. Cook P.E.,Vice President Engineering, Inductoheat; Daniel K. Green Ph.D., ABB Metallurgy, Inc.; Robert A. Jones *, Independent Electric. Contr.; Louis J. Moliterno, Director Production Engineering, Ajax Magnethermic, Gary Moore, Manager of Engineering, INTAT Precision Inc.; John H. Mortimer P.E.*, Task Group Chairman, Inductotherm; Ronald L. Purvis *, Georgia Power Co.; Rafik Ramjee, Senior Technical Advisor, Pillar Industries; Raymond J. Roberts P.E., Consarc Corporation; Paul F. Scott, Ph.D., V.P. Technology; L. J. Schell, HiTecMetal Group; Ronald Tobar, Sr. Electrical Engineer, Arvin Central Tubing Facility; Charles M. Trout, Chairman *, Code-Making Panel No. 12; Robert C. Turner P.E. **, Inductotherm Corp.; Gregg Warner, Radyne Inc.; Robert A. Watson P.E., ABB Metallurgy, Inc.
* Member Code-Making Panel No. 12
** Alternate Member Code-Making Panel No. 12.
PANEL ACTION: Accept.

VOTE ON PANEL ACTION:
AFFIRMATIVE: 12
NOT RETURNED: 2 Kelly, Laney

(Log #3279)

12- 115 - (665-23): Reject
SUBMITTER: Alan Manche, Square D Co.
RECOMMENDATION: Revise 665-23 with the additions (underlined) and deletions (strike through) as shown. The entire text is shown for clarity, but only those changes shown underlined or strike through are part of this proposal.
665-23. Warning Labels or Signs. Warning labels or signs ~~that read~~ with the following words or equivalent: "DANGER - HIGH VOLTAGE - KEEP OUT" shall be attached to the equipment and shall be plainly visible where unauthorized persons might come in contact with energized parts, even when doors are open or when panels are removed from compartments containing over 250 volts ac or dc.
SUBSTANTIATION: The explicit nature of the present wording is causing field problems in the acceptance of appropriate warning signs or markings. The ANSI Z535 series of standards provides the proper procedure in establishing a hazard sign or marking. ANSI Z535.4 provides the information about what should be contained in a hazard sign or label. This includes a message panel that identifies the hazard, indicates how to avoid the hazard and advises the probable consequence of not avoiding the hazard.
The objective of the NEC wording is to generally convey the basic message requirement to user. However, in order to comply with Z535.4, the exact words stated in the NEC may not be appropriate for the contemplated circumstances. Revising the text to allow "or equivalent" would allow a hazard sign to comply with the NEC, but be formated in accordance with Z535.4.
PANEL ACTION: Reject.
PANEL STATEMENT: See the panel action on Proposal 12-25.

(Log #982)

12- 119 - (668-21(a)): Reject
SUBMITTER: Dan Leaf, Palmdale, CA
RECOMMENDATION: Revise second sentence to read as follows:
Power for these circuits shall be supplied through isolating transformers with an ungrounded secondary.
SUBSTANTIATION: This section does not clearly specify the secondary to be ungrounded. The secondary of an isolating transformer can be grounded (as required in Section 250-26). Subsection (c) clearly indicates an isolating transformer with an

ungrounded secondary but doesn't mandate such secondary. The phrase "isolating transformer" is not synonymous with either a grounded or ungrounded secondary. Circuit (conductor) can be ungrounded yet supplied from a grounded system, such as a 2-wire 240-volt circuit from a 120/240 volt grounded system. See Sections 210-10, 215-7.
PANEL ACTION: Reject.
PANEL STATEMENT: The submitter's concern is clearly addressed by the last sentence of 668-21(a). The submitter has not provided adequate substantiation to document problems with the current language.

ARTICLE 670 — INDUSTRIAL MACHINERY

(Log #559)

11- 105 - (670): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 670-5, replace "21/2 ft. (762 mm)" with "750 mm (2 1/2 ft.)".
2. In Section 670-5 Exception, replace "2 1/2 ft (762 mm)" with "750 mm (2 1/2 ft.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement.
PANEL ACTION: Accept.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 14
NEGATIVE: 1
EXPLANATION OF NEGATIVE:
GARVEY: The conversion was improperly made. Section 670-5 contains requirements that address the depth of the workplace. The section reduces the minimum depth of 3-feet required by Table 110-26(a) under certain conditions. When the conversion was made, the Technical Correlating Committee rounded down. The conversion should be exact. When the issue is safe workplace every millimeter counts.

(Log #3419)

11- 106 - (670-1): Reject
SUBMITTER: Nicholas T. Abbatiello, Spencerport, NY
RECOMMENDATION: Add to scope to include paragraph 670-5, Clearances.
SUBSTANTIATION: Make scope more accurately describe requirements of Article 670, Industrial Machinery.
PANEL ACTION: Reject.
PANEL STATEMENT: It is not necessary to revise the scope of Article 670 to apply 670-5.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #3095)

11- 107 - (670-3): Accept
SUBMITTER: Larry F. Miller, Nat'l Electrical Mfrs Assn. (NEMA)
RECOMMENDATION: Revise the text to read as follows:
(a) Permanent Nameplate. A permanent nameplate that lists supply voltage, phase, frequency, full-load current, the maximum ampere rating of the short-circuit and ground-fault protective device, ampere rating of largest motor or load, short-circuit interrupting ~~capacity~~ rating of the machine overcurrent protective device, if furnished, and diagram number shall be attached to the control equipment enclosure or machine where plainly visible after installation.
SUBSTANTIATION: The rating applied to an overcurrent protective device is an interrupting rating, which is defined in the NEC. For correleation, the the definition of "interrupting rating" in Article 100 and Sections 110-9, 240-60(c) and 240-83(c).
PANEL ACTION: Accept.
PANEL STATEMENT: The panel action applies to the first paragraph only.
NUMBER OF PANEL MEMBERS ELIGIBLE TO VOTE: 15
VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #2843)

11- 108 - (670-3(a)): Accept in Principle
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Revise the second paragraph second sentence by inserting the words: "…or permit under-sizing conductors…" as indicated:
670-3. Machine Nameplate Data.
(a) Permanent Nameplate. A permanent nameplate that lists supply voltage, phase, frequency, full-load current, the maximum ampere rating of the short-circuit and ground-fault protective device, ampere rating of largest motor or load, short-circuit interrupting capacity of the machine overcurrent-protective device, if furnished, and diagram number shall be attached to the control equipment enclosure or machine where plainly visible after installation.
The full-load current shown on the nameplate shall not be less than the sum of the full-load currents required for all motors and other equipment that may be in operation at the same time under normal conditions of use. Where unusual type loads, duty cycles, etc., require oversized conductors or permit under-sizing conductors, the required capacity shall be included in the marked "full-load current." Where more than one incoming supply circuit is to be provided, the nameplate shall state the above information for each circuit.
(b) Overcurrent Protection. Where overcurrent protection is provided in accordance with Section 670-4(b), the machine shall be marked "overcurrent protection provided at machine supply terminals."
SUBSTANTIATION: Not all unusual loads or duty cycles require over-sizing, and this will allow machine application of Sections 310-15(a) and 430-26. For instance, in many instances motors and related equipment selection is based upon torque values to provide break-away capability and then run the remainder of the time barely above no-load current values.
PANEL ACTION: Accept in Principle.
Change recommended wording to "or permit reduced size conductors."
PANEL STATEMENT: In this situation, the conductors would not be undersized. The panel action on Proposal 11-107 changes the first paragraph of 670-3(a).

VOTE ON PANEL ACTION:
AFFIRMATIVE: 15

(Log #3420)

11- 109 - (670-3(a)): Reject
SUBMITTER: Nicholas T. Abbatiello, Spencerport, NY
RECOMMENDATION: The paragraph is long and should be itemized to make more understandable. Additionally, the requirement for heater loads needs to be provided so the ampacity can be calculated based on 125 percent of continuous heater load current.
SUBSTANTIATION: The ampacity of the supply conductors requires the load current of heaters to be known since ampacity is based on 125 percent of that value.
PANEL ACTION: Reject.
PANEL STATEMENT: The proposal does not include any recommended text in accordance with 4-3.3(c) of the NFPA Regulations Governing Committee Projects.

11- 110 - (670-3(a)): Reject
SUBMITTER: Nicholas T. Abbatiello, Spencerport, NY
RECOMMENDATION: Add Exception to the requiring the ampere rating of the largest motor or load providing that the ampacity value of the supply conductors is provided.
SUBSTANTIATION: The ampacity of the supply conductors requires the load current of heaters to be known since ampacity is based on 125 percent of that value and 125 percent of the largest motor load in addition to all other loads. In many cases, the installers need to do the calculations to determine the value. The exception would eliminate the need for the installer to do if already done by the manufacturer of the industrial machinery. The end result is the same and there is less chance of disagreement with code enforcement personnel, especially if the machinery has to be Listed or Labeled.
PANEL ACTION: Reject.
PANEL STATEMENT: The panel agrees that the end result would (or should) be the same, and notes that application of the Code requires frequent calculations by the installer. The ampacity of the supply conductors is a permitted marking.

(Log #2844)

11- 111 - (670-4(a)): Accept
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Revise to add the following words: "…based on their duty cycle…"
(a) Size. The size of the supply conductor shall be such as to have an ampacity not less than 125 percent of the full-load current rating of all resistance heating loads plus 125 percent of the full-load current rating of highest rated motor plus the sum of the full-load current ratings of all other connected motors and apparatus based on their duty cycle that may be in operation at the same time.
FPN: See the 0–2000-volt ampacity tables of Article 310 for ampacity of conductors rated 600 volts and below.
SUBSTANTIATION: A machine operating cycle may involve numerous load-no-load conditions for a given operation. These are determined under engineering supervision and do not vary much over the life of the unit. This will allow machine application of what Sections 310-15(a) and 430-26 presently permit for facilities.
PANEL ACTION: Accept.

(Log #2845)

11- 112 - (670-4(b)): Reject
SUBMITTER: Melvin K. Sanders, Ankeny, IA
RECOMMENDATION: Revise the second and third sentence of Section 6670-4(b):
(b) Overcurrent Protection. A machine shall be considered as an individual unit and therefore shall be` provided with a disconnecting means. ~~The~~ This disconnecting means shall be permitted to be supplied by branch circuits protected by either fuses or circuit breakers. The disconnecting means shall not be required to incorporate overcurrent protection. Where furnished as part of the machine, overcurrent protection shall consist of a single circuit breaker or set of fuses~~,~~ and the machine shall bear the marking required in Section 670-3~~, and the supply conductors shall be considered either as feeders or taps as covered by Section 240-21~~.
SUBSTANTIATION: "The" changed to "This" in the second sentence to clarify this applies to the machine disconnecting means being supplied by a branch circuit. Supply conductors to machines meet the definition of branch-circuits in Article 100, as supplying power to an outlet as it is defined in Article 100. These loads may be further sub-divided within or on the machine and at that point provided with additional overcurrent protection as provided for in Section 240-10 that is unique for proper machine operation.
PANEL ACTION: Reject.
PANEL STATEMENT: The supply conductors to industrial machinery are permitted to be feeders or feeder taps. The proposed change would allow the use of supplementary overcurrent devices where branch circuit overcurrent protective devices are required.

11- 113 - (670-5, Exception): Reject
SUBMITTER: Collins Jaskowiak, BOC Edwards
RECOMMENDATION: Add note as to minimum door opening, about 45°.
SUBSTANTIATION: Better clarification of exception.
PANEL ACTION: Reject.
PANEL STATEMENT: The exception does not reduce the 90 degree requirement of the basic rule and the submitter has provided no substantiation to reduce this value.

ARTICLE 675 — ELECTRICALLY DRIVEN OR CONTROLLED IRRIGATION MACHINES

(Log #525)

19- 154 - (675): Accept
SUBMITTER: Technical Correlating Committee National Electrical Code
RECOMMENDATION: 1. In Section 675-4(a), replace "30 mils (762 µm)" with "0.76 mm (30 mils)"; "8 mils (203 µm)" with "0.20 mm (8 mils)"; and "50 mils (1.27 mm)" with "1.27 mm (50 mils)".
2. In Section 675-4(c), replace "4 ft (1.22 m)" with "1.2 m (4 ft)".
3. In Section 675-8(b), replace "50 ft (15.2 m)" with "15 m (50 ft)".
4. In Section 675-10(a)(3), replace "25 ft (7.62 m)" with "7.5 m (25 ft.)".
SUBSTANTIATION: The proposed revision is intended to comply with the NFPA No. 1M Manual of Style Section 4.1 with respect to the placement of units and values of measurement, i.e., show SI units as the preferred and inch-pound units immediately following.
In Item 1, the SI units are not rounded since the values are product-related and specify a minimum safety level.
PANEL ACTION: Accept.
